

PY32F003 Datasheet

32-bit ARM® Cortex®-M0+ Microcontroller

Puya Semiconductor (Shanghai) Co., Ltd

Features

- Core
 - 32-bit ARM® Cortex® - M0+ CPU
 - Up to 32 MHz operating frequency
- Memories
 - Maximum 64 Kbytes of flash memory
 - Up to 8 Kbytes SRAM
- Clock system
 - Internal 4/8/16/ 22.12/24 MHz RC Oscillator (HSI)
 - Internal 32.768 KHz RC oscillator (LSI)
 - 4 to 32 MHz crystal oscillator (HSE)
- Power management and reset
 - Operating voltage(x6 version): 1.7 V to 5.5 V
 - Operating voltage(x7 version): 2.0 V to 5.5 V
 - Low power modes: Sleep and Stop
 - Power-on/Power-down reset (POR/PDR)
 - Brownout Detect Reset (BOR)
 - Programmable Voltage Detection (PVD)
- General purpose input and output (I/O)
 - Up to 18 I/Os, all available as external interrupts
 - Driver current 8mA
- 3-channel DMA controller
- 1 x 12-bit ADC
 - Supports up to 10 external input channels
 - Input voltage conversion range: 0 ~ Vcc
- Timer
 - A 16bit advanced control timer (TIM1)
 - 4 general purpose 16-bit timers (TIM3/TIM14/TIM16/TIM17)
 - A low-power timer (LPTIM), supports wake-up from Stop mode
 - An Independent Watchdog Timer (IWDT)
 - A Window Watchdog Timer (WWDT)
 - A SysTick timer
 - A IRTIM
- RTC
- Communication Interface
 - A Serial Peripheral Interface (SPI)
 - Two Universal Synchronous / Asynchronous Transceivers (USARTs) with automatic baud rate detection
 - A I²C interface , supports standard mode (100 KHz) , Fast mode (400 kHz) , supports 7-bit addressing mode
- Hardware CRC-32 module
- Two comparators
- Unique UID
- Serial wire debug (SWD)
- Operating temp. (x6 version): -40 to 85°C
- Operating temp. (x7 version): -40 to 105°C
- Package: TSSOP20,QFN20,SOP20,SOP16, MSOP10,SOP8, DFN8(3*2)

1. Introduction

PY32F003 series microcontrollers are MCUs with high performance 32-bit ARM® Cortex® -M0 + core, wide voltage operating range. It has embedded up to 64 Kbytes flash and 8 Kbytes SRAM memory, a maximum operating frequency of 32 MHz, and contains various products in different package types. The chip integrates multi-channel I²C, SPI, USART and other communication peripherals, one channel 12bit ADC, five 16bit timers, and two-channel comparators.

PY32F003 series microcontrollers are -40 °C ~ 85 °C and -40 °C ~ 105 °C, the operating voltage range are 1.7 V ~ 5.5 V and 2.0 V ~ 5.5 V. The chip provides sleep and stop low-power operating modes from meeting different low-power applications.

The PY32F003 series of microcontrollers are suitable for various application scenarios, such as controllers, portable devices, PC peripherals, gaming and GPS platforms, industrial applications.

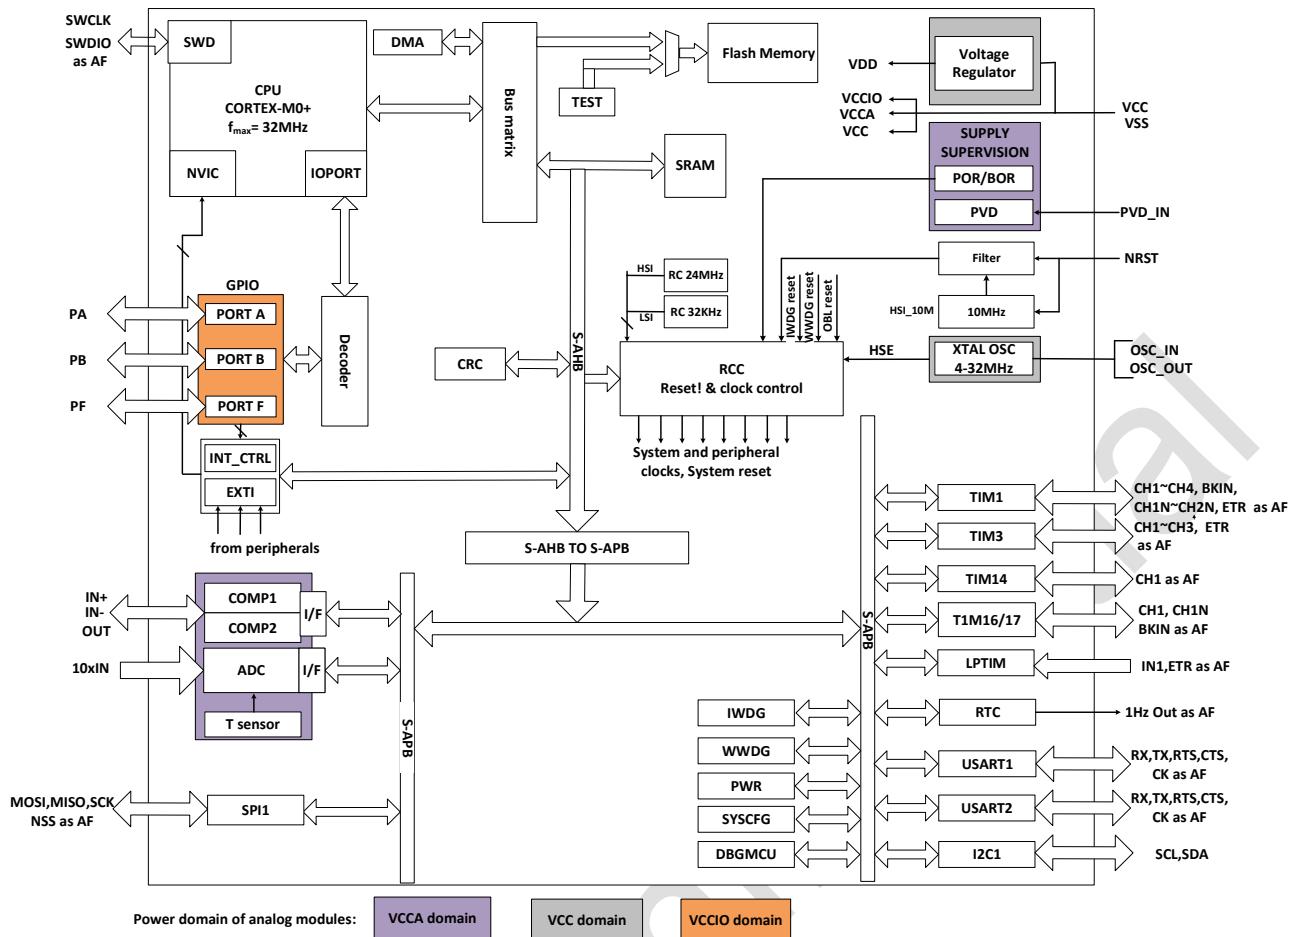

Figure 1-1 Functional Module

2. Functional overview

2.1. Arm®Cortex®-M0+ core

Arm ® The Cortex ® - M0+ is an entry-level 32-bit Arm Cortex processor designed for a wide range of embedded applications. It provides developers with significant benefits, including:

- Simple structure, easy to learn and program
- Ultra-low power consumption, energy-saving operation
- Reduced code density and more

Cortex-M0+ processor is a 32-bit core optimized for area and power consumption and is a 2-stage pipeline Von Neumann architecture. The processor offers high-end processing hardware, including single-cycle multipliers, through a streamlined but powerful instruction set and an extensively optimized design. Moreover, it delivers the superior performance expected from a 32-bit architecture computer, with a higher coding density than other 8 and 16-bit microcontrollers.

The Cortex-M0+ is tightly coupled with a Nested Vectored Interrupt Controller (NVIC).

2.2. Memories

The on-chip integrated SRAM is accessed by bytes (8 bits), half-word (16bits) or word (32bits).

The on-chip integrated Flash consists of two different physical areas:

- Main flash area, which contains application and user data
- The information area has 4K bytes, and it includes the following parts:
 - Option bytes
 - UID bytes
 - System memory

The protection of Flash main memory includes the following mechanisms:

- Read protection(RDP) prevents access from outside.
- Write protection (WRP) control prevents unwanted writes (confuse by program memory pointer from PC). The minimum protection unit for write protection is 4K bytes.
- Option byte write protection, special unlocking design.

2.3. Boot mode

Through BOOT0 pin and boot configuration bit nBOOT1 (stored in Option bytes), three different boot modes can be selected, as shown in the following table:

Table 2-1Boot configuration

Boot mode configuration		Mode
nBOOT1 bit	BOOT0 pin	
X	0	Select Main flash as the boot area
1	1	Select System memory as the boot area

Boot mode configuration		Mode
nBOOT1 bit	BOOT0 pin	
0	1	Select SRAM as the boot area

The Boot loader program is stored in the System memory and used to download the Flash program through the USART interface.

2.4. Clock System

After the CPU starts, the default system clock frequency is HSI 8 MHz, and the system clock frequency and system clock source can be reconfigured after the program runs. The high frequency clocks that can be selected are:

- A 4 /8/16/ 22.12/ 24 MHz configurable internal high precision HSI clock.
- A 32.768 KHz configurable internal LSI clock.
- 4 ~ 32 MHz HSE clock can enable the CSS function to detect HSE. If CSS fails, the hardware will automatically convert the system clock to HSI, and software configures the HSI frequency. Simultaneously, CPU NMI interrupt is generated.

The AHB clock can be divided based on the system clock, and the APB clock can be divided based on the AHB clock. AHB and APB clock frequencies up to 32 MHz.

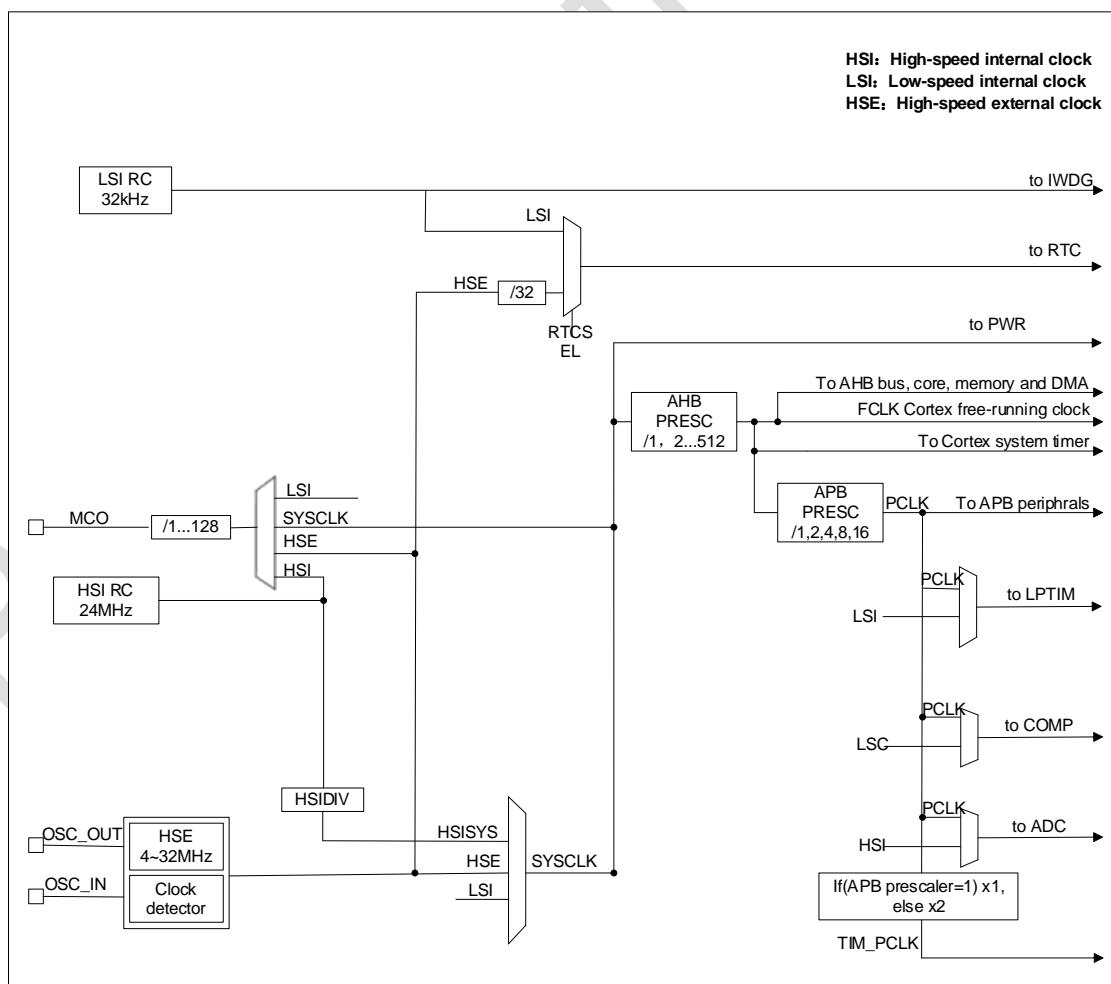

Figure 2-1 System Clock Structure Diagram

2.5. Power management

2.5.1. Power block diagram

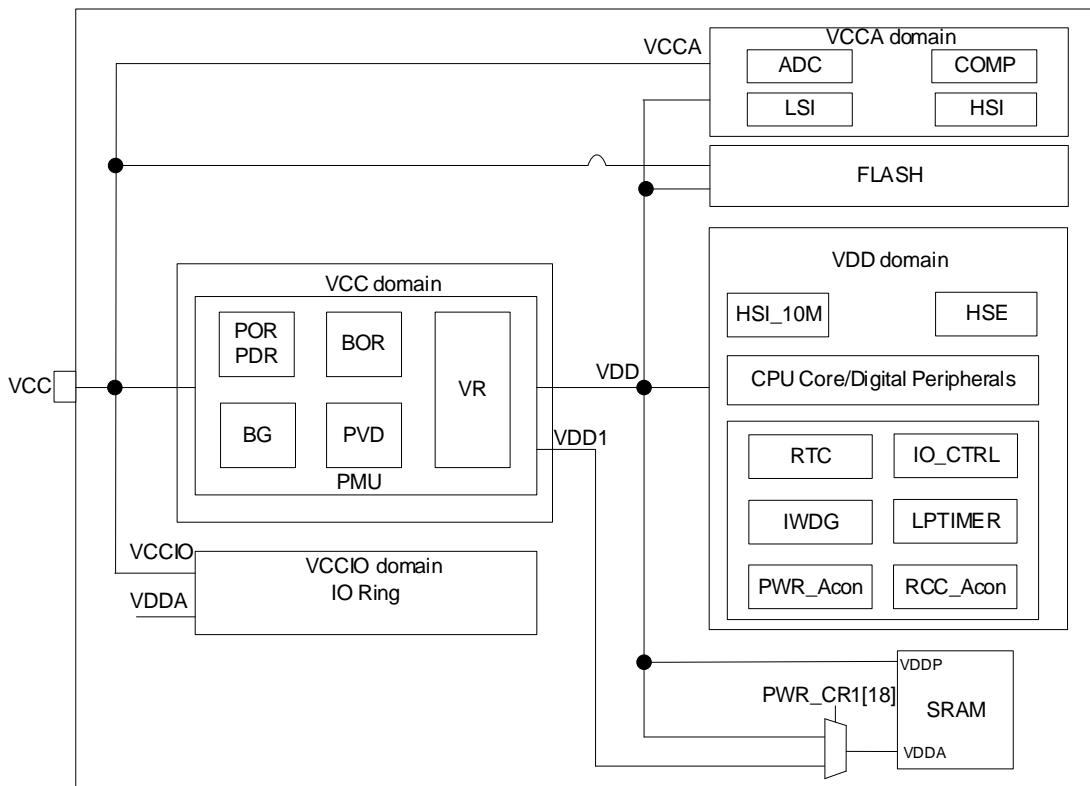

Figure 2-2 Power Block Diagram

Table 2-2 Power Block Diagram

NO.	Power supply	Condition	Power value	Describe
1	Vcc	x6 version	1.7 V ~ 5.5 V	The chip is supplied with power through the power pins, and its power supply module is part of the analogue circuit.
		x7 version	2.0 V ~ 5.5 V	
2	VCCA	x6 version	1.7 V ~ 5.5 V	Power to most analogue modules from Vcc PAD (a separate power supply PAD can also be designed).
		x7 version	2.0 V ~ 5.5 V	
3	VCCIO	x6 version	1.7 V ~ 5.5 V	Power supply to IO, from Vcc PAD
		x7 version	2.0 V ~ 5.5 V	
4	VDD		1.2 V/1.0 V ± 10 %	VR supplies power to the main logic circuits and SRAM inside the chip. When the MR is powered, it outputs 1.2 V. According to the software configuration, entering the stop mode can be powered by MR or LPR, and the LPR output is determined to be 1.2 V or 1.0 V.

2.5.2. Power monitoring

2.5.2.1. Power on reset (POR/PDR)

The Power on reset (POR)/Power down reset (PDR) module is designed to provide power-on and power-off reset for the chip. The module keeps working in all modes.

2.5.2.2. Brown-out reset (BOR)

In addition to POR/ PDR, BOR (brown-out reset) is also implemented. BOR can only be enabled and disabled through the option byte.

When the BOR is turned on, the BOR threshold can be selected by the Option byte, and both the rising and falling detection points can be configured individually.

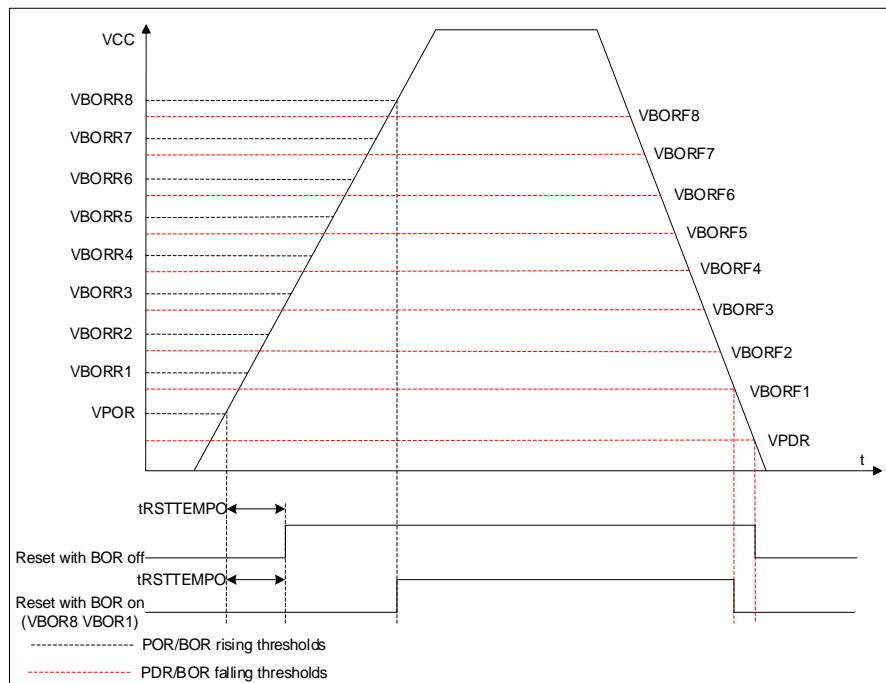

Figure 2-3 POR/PDR/BOR threshold

2.5.2.3. Voltage detection (PVD)

Programmable Voltage Detector (PVD) module can be used to detect the V_{CC} power supply (it can also detect the voltage of the PB7 pin), and the detection point can be configured through the register.

When V_{CC} is higher or lower than the detection point of PVD, a corresponding reset flag is generated.

This event is internally connected to line 16 of EXTI , depending on the rising/falling edge configuration of EXTI line 16. When V_{CC} rises above the PVD detection point, or V_{CC} falls below the PVD detection point , an interrupt is generated. In the service program, users can perform urgent shutdown tasks.

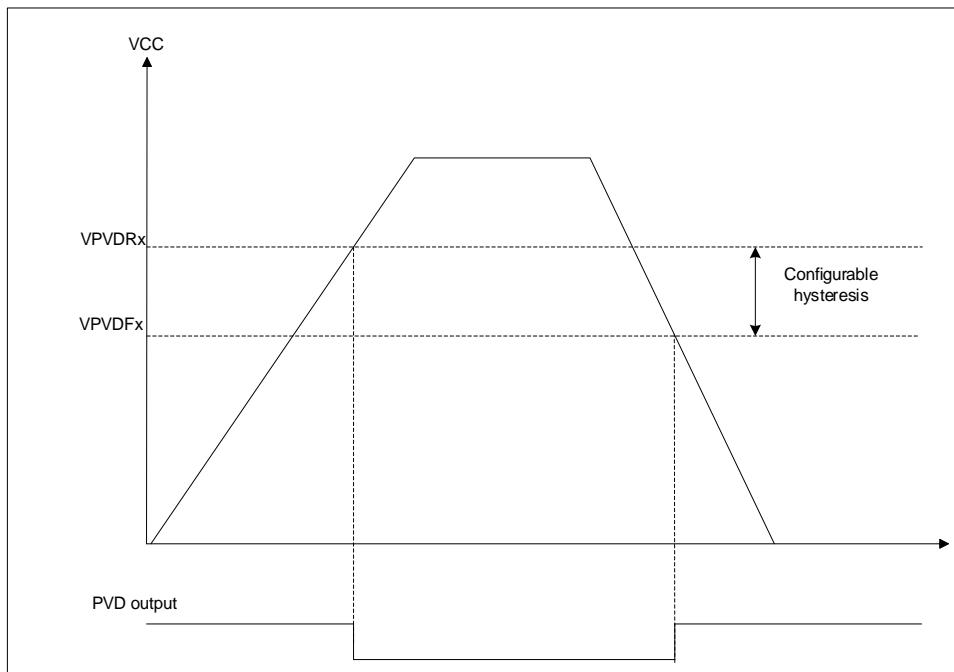

Figure 2-4 PVD Threshold

2.5.3. Voltage regulator

The chip designs two voltage regulators:

- MR (Main regulator) keeps working when the chip is in normal operating state.
- LPR (Low power regulator) provides a lower power consumption option in stop mode.

2.5.4. Low power mode

In addition to the normal operating mode, the chip has 2 low-power modes:

- **Sleep mode:** Peripherals can be configured to keep working when the CPU clock is off (NVIC, SysTick, etc.). It is recommended only to enable the modules that must work, and close the module after the module works.
- **Stop mode:** In this mode, the contents of SRAM and registers are maintained, HSI and HSE are turned off, and most modules of clocks in the V_{DD} domain are stopped. GPIO, PVD, COMP output, RTC and LPTIM can wake up stop mode.

2.6. Reset

Two resets are designed in the chip: power and system reset.

2.6.1. Power reset

A power reset occurs in the following situations:

- Power on reset (POR/PDR)
- Brown-out reset (BOR)

2.6.2. System reset

A system reset occurs when the following events occur:

- Reset of NRST pin
- Windowed Watchdog Reset (WWDG)
- Independent Watchdog Reset (IWDG)
- SYSRESETREQ software reset
- Option byte load reset (OBL)
- Power reset (POR/PDR , BOR)

2.7. General-purpose input and output (GPIOs)

The software configures each GPIO as output (push-pull or open-drain), input (floating, pull-up/down, analogue), peripheral multiplexing function, and locking mechanism freeze I/O port configuration function.

2.8. DMA

Direct Memory Access (DMA) provides high-speed data transfer between peripherals and memory or between memory and memory.

DMA controller has three channels, and each channel is responsible for managing memory access requests from one or more peripherals. The DMA controller includes an arbiter for handling DMA requests for each DMA request's priority..

DMA supports circular buffer management, eliminating the need for user code to intervene when the controller reaches the end of the buffer.

Each channel is directly connected to a dedicated hardware DMA request, and each channel also supports software triggering. These functions are configured through software.

DMA is available for peripherals: SPI, I²C, USART, all TIMx timers (except TIM14 and LPTIM) and ADC.

2.9. Interrupt

The PY32F003 handles exceptions through the Cortex-M0+ processor's embedded Vectored Interrupt Controller (NVIC) and an Extended Interrupt/Event Controller (EXTI).

2.9.1. Interrupt controller NVIC

NVIC is a tightly coupled IP inside the Cortex-M0+ processor. The NVIC can handle NMI (Non-Maskable Interrupts) and maskable external interrupts from outside the processor and Cortex-M0+ internal exceptions. NVIC provides flexible priority management.

The tight coupling of the processor core to the NVIC greatly reduces the delay between an interrupt event and the initiation of the corresponding interrupt service routine (ISR). The ISR vectors are listed in a vector table, stored at a base address of the NVIC. The vector table base address determines the vector address of the ISR to execute, and the ISR is used as the offset composed of serial numbers. If a high-priority interrupt event occurs and a low-priority interrupt event is just waiting to be serviced, the later-arriving high-priority interrupt event will be serviced first. Another optimization is called tail-chaining. When returning from a high-priority ISR and then starting a pending low-priority ISR, unnecessary pushes and pops of processor contexts will be skipped. This reduces latency and improves power efficiency.

NVIC features:

- Low latency interrupt handling
- Level 4 Interrupt Priority
- Supports one NMI interrupt
- Supports 32 maskable external interrupts
- Supports 10 Cortex-M0+ exceptions
- High-priority interrupts can interrupt low-priority interrupt responses
- Support tail-chaining optimization
- Hardware Interrupt Vector Retrieval

2.9.2. Extended interrupt/event controller (EXTI)

EXTI adds flexibility to handle physical wire events and generates wake-up events when the processor wakes up from stop mode.

The EXTI controller has multiple channels, including a maximum of 16 GPIOs, 1 PVD output, 2 COMP outputs, RTC and LPTIM wake-up signals. GPIO, PVD and COMP can be configured to be triggered by a rising edge, falling edge or double edge. Any GPIO signal can be configured as EXTI0 ~ 15 channel through the select signal.

Each EXTI line can be independently masked through registers.

The EXTI controller can capture pulses shorter than the internal clock period.

Registers in the EXTI controller latch each event. Even in stop mode, after the processor wakes up from stop mode, it can identify the wake-up source or identify the GPIO and event that caused the interrupt.

2.10. Analog to digital converter (ADC)

The chip has a 12-bit SAR ADC. The module has up to 10 channels to be measured, including 8 external channels and 2 internal channels.

The conversion mode of each channel can be set to single, continuous, sweep, discontinuous mode. Conversion results are stored in left or right-aligned 16-bit data registers.

An analogue watchdog allows the application to detect if the input voltage exceeds a user-defined high or low threshold.

The ADC has been implemented to operate at a low frequency, resulting in lower power consumption.

At the end of sampling, conversion, and continuous conversion, an interrupt request is generated when the conversion voltage exceeds the threshold when simulating the watchdog.

2.11. Comparators (COMP)

- Each comparator has configurable positive or negative inputs for flexible voltage selection
 - Multiple I/O pins
 - Power supply V_{CC}
 - The output of the temperature sensor
 - Internal reference voltage and 3-part values supplied by divider (1/4, 1/2, 3/4)
- The hysteresis function is configurable
- Programmable speed and power consumption
- The output can be connected to the input of I/O or timer as a trigger
 - OCREF_CLR event (current control of cycle by cycle)
 - Brakes for fast PWM shutdown

Each COMP has interrupt generation capability to act as a wake-up of the chip from low-power modes (sleep and stop modes) (via EXTI)

2.12. Timer

The characteristics of different timers of PY32F003 are shown in the following table:

Table 2-3 Timer Features

Types	Timer	Bit Width	Counting Direction	Prescaler	DMA	Capture /compare channel	Complementary output
Advanced	TIM1	16-bit	superior, Down, center aligned	1 ~ 65536	support	4	3
General purpose	TIM3	16-bit	superior, Down, center aligned	1 ~ 65536	support	4	-
	TIM14	16-bit	superior	1 ~ 65536	-	1	-
	TIM16, TIM17	16-bit	superior	1 ~ 65536	support	1	1

2.12.1. Advanced timer

The advanced timer (TIM1) consists of a 16-bit auto-reload counter driven by a 16-bit programmable prescaler. It can be used in various scenarios, including pulse length measurement of input signals

(input capture) or generating output waveforms (output compare, output PWM, complementary PWM with dead-time insertion).

TIM1 includes 4 independent channels:

- Input capture
- Output comparison
- PWM generation (edge or center-aligned mode)
- Single pulse mode output

If TIM1 is configured as a standard 16-bit timer, it has the same characteristics as the TIMx timer. Full modulation capability (0-100%) if configured as a 16-bit PWM generator.

In the MCU debug mode, TIM1 can freeze counting.

The timer feature with the same architecture is shared so that the TIM1 can work with other timers for synchronization or event chaining through the timer chaining function.

TIM1 supports the DMA function.

2.12.2. General-purpose timer

2.12.2.1. TIM3

The general-purpose timer TIM3 consists of a 16-bit auto-reload counter driven by a 16-bit programmable prescaler. It has 4 independent channels, each for input capture/output compare, PWM or single pulse mode output.

TIM3 can work with TIM1 through the timer link function.

TIM3 supports the DMA function.

The TIM3 can process quadrature (incremental) encoder signals and digital outputs from 1 to 3 Hall Effect Sensors.

In the MCU debug mode, the TIM 3 can freeze counting.

2.12.2.2. TIM14

The general-purpose timer TIM14 consists of a 16-bit auto-reload counter driven by a 16-bit programmable prescaler.

TIM14 has one independent channel for input capture/output compare, PWM or single pulse mode output.

In the MCU debug mode, the TIM14 can freeze counting.

2.12.2.3. TIM16/TIM17

The general-purpose timer TIM16 and TIM17 consists of a 16-bit auto-reload counter driven by a 16-bit programmable prescaler.

TIM16/TIM17 have 1 independent channel for input capture/output compare, PWM or single pulse mode output.

TIM16/TIM17 have one independent channel for input capture/output compare, PWM or single pulse mode output.

TIM16/TIM17 have complementary outputs with dead time.

TIM16/TIM17 supports the DMA function.

In the MCU debug mode, TIM 16/TIM17 can freeze counting.

2.12.3. Low power timer (LPTIM)

LPTIM is a 16-bit up counter with a 3-bit prescaler and only support a single count.

LPTIM can be configured as a stop mode wakeup source.

In the MCU debug mode, LPTIM can freeze the count value.

2.12.4. IWDG

Independent watchdog (IWDG) is integrated in the chip, and this module has the characteristics of high-security level, accurate timing and flexible use. IWDG finds and resolves functional confusion due to software failure and triggers a system reset when the counter reaches the specified timeout value.

The IWDG is clocked by LSI, so even if the main clock fails, it can keep working.

IWDG is the best suited for applications that require the watchdog as a standalone process outside of the main application and do not have high timing accuracy constraints.

Controlling of option byte can enable IWDG hardware mode.

IWDG is the wake-up source of stop mode, which wakes up stop mode by reset.

In the MCU debug mode, IWDG can freeze the count value.

2.12.5. WWDG

The system window watchdog is based on a 7-bit down counter and can be set to free-run. It acts as a watchdog to reset the system when a failure shows. The count clock is the APB clock (PCLK). It has early warning interrupt capability, and the counter can be freeze in the MCU debug mode.

2.12.6. SysTick timer

SysTick counters are specifically for real-time operating systems (RTOS) also can use as standard down counters.

SysTick Features:

- 24-bit count down
- Self-loading capability
- An interrupt can be generated when the counter reaches 0 (maskable)

2.13. Real time clock (RTC)

The real-time clock is an independent timer. It has a set of continuous counting counters, which can provide a clock calendar function under the corresponding software configuration. Modifying the value of the counter can reset the current time and date of the system.

RTC is a 32-bit programmable counter with a prescale factor of up to 2^{20} bits.

The RTC counter clock source can be LSI and the stop wake-up source.

RTC can generate alarm interrupt, second interrupt and overflow interrupt (maskable).

RTC supports clock calibration.

In the MCU debug mode, RTC can freeze counting.

2.14. I²C interface

I²C (inter-integrated circuit) bus interface connects the microcontroller and the serial I²C bus. It provides multi-master capability and controls all I²C bus specific sequences, protocols, arbitration and timing. Standard (Sm) and fast (Fm) are supported.

I²C Features:

- Slave and master mode
- Multi-host function: can be master or slave
- Support different communication speeds
 - Standard Mode (Sm): Up to 100 kHz
 - Fast Mode (Fm): up to 400 kHz
- As master
 - Generate Clock
 - Generation of Start and Stop
- As slave
 - Programmable I²C address detection
 - Discovery of the Stop bit
- 7-bit addressing mode
- General call
- Status flag
 - Transmit/receive mode flags
 - Byte transfer complete flag
 - I²C busy flag bit
- Error flag
 - Master arbitration loss
 - ACK failure after address/data transfer
 - Start/Stop error
 - Overrun/Underrun (clock stretching function disable)

- Optional Clock Stretching
- Single-byte buffer with DMA capability
- Software reset
- Analogue noise filter function

2.15. Universal synchronous asynchronous receiver/transmitter (USART)

PY32F003 contains 2 USARTs with precisely the same functions.

The Universal Synchronous Asynchronous Transceiver (USART) provides a flexible method for full-duplex data exchange with external devices using the industry-standard NRZ asynchronous serial data format. The USART utilizes a fractional baudrate generator to provide a wide range of baudrate options.

It supports simultaneous one-way communication and half-duplex single-wire communication, and it also allows multi-processor communication.

Automatic baudrate detection is supported.

High-speed data communication can be achieved by using the DMA method of the multi-buffer configuration.

USART features:

- Full-duplex asynchronous communication
- NRZ standard format
- Configurable 16 times or 8 times oversampling for increased flexibility in speed and clock tolerance
- Programmable baudrate shared by transmit and receive, up to 4.5 Mbit/s
- Automatic baudrate detection
- Programmable data length of 8 or 9 bits
- Configurable stop bits (1 bit or 2 bits)
- Synchronous mode and clock output function for synchronous communication
- Single-wire half-duplex communication
- Independent transmit and receive enable bits
- Hardware flow control
- Receive/transmit bytes by DMA buffer
- Detection flag
 - Receive full buffer
 - Send empty buffer
 - End of transmission
- Parity Control
 - Send check digit
 - Check the received data

- Flagged interrupt sources
 - CTS change
 - Send empty register
 - Send completed
 - Receive full data register
 - Bus idle detected
 - Overflow error
 - Frame error
 - Noise operation
 - Error detection
- Multiprocessor communication
 - If the address does not match, enter silent mode
- Wake-up from silent mode: by idle detection and address flag detection

2.16. Serial peripheral interface (SPI)

PY32F003 contains one SPI.

Serial Peripheral Interface (SPI) allows the chip to communicate with external devices in half-duplex, full-duplex, and simplex synchronous serial communication. This interface can be configured in master mode and provides the communication clock (SCK) for external slave devices. The interface can also work in a multi-master configuration.

The SPI features are as follows:

- Master or slave mode
- 3-wire full-duplex simultaneous transmission
- 2-wire half-duplex synchronous transmission (with bidirectional data line)
- 2-wire simplex synchronous transmission (no bidirectional data line)
- 8-bit or 16-bit transmission frame selection
- Support multi-master mode
- 8 master mode baudrate prescaler factors (max $f_{PCLK}/4$)
- Slave mode frequency (max $f_{PCLK}/4$)
- Both master and slave modes can be managed by software or hardware NSS: dynamic change of master/slave operating mode
- Programmable clock polarity and phase
- Programmable data order, MSB first or LSB first
- Dedicated transmit and receive flags that can trigger interrupts
- SPI bus busy status flag
- Motorola mode
- Interrupt-causing master mode faults, overloads
- Two 32-bit Rx and Tx FIFOs with DMA capability

2.17. SWD

The ARM SWD interface allows serial debugging tools to be connected to the PY32F003.

Table 3-1 Pin definition terminology and symbols

Types		Symbol	Definition
Port type	S	Supply pin	
	G	Ground pin	
	I/O	Input/output pin	
	NC	Undefined	
Port structure	COM	5V port, support analogue input and output function	
	RST	Reset port, with internal weak pull-up resistor, does not support analog input and output function	
Notes		-	Unless other specified, all ports are used as floating inputs between and after reset
Port function	Multiplexing function	-	Function selected by GPIOx_AFR register
	Additional function	-	Directly selected or enabled through peripheral registers

1. The address space marked as Reserved by AHB in the above table cannot be written, read is 0, and a hardfault is generated. The address space marked as Reserved by APB cannot be written, read back as 0, but no hardfault will be generated.
2. Not only supports 32 bits word access, but also supports halfword and byte access.
3. Not only supports 32 bits word access, but also supports halfword access.

5. Electrical characteristics

5.1. Test conditions

All voltages are referenced to V_{SS} unless otherwise specified.

5.1.1. Min and Max

Unless otherwise specified, the chip is screened by mass production testing at ambient temperature T_A = 25°C and T_A = T_{A(max)}, guaranteed to reach the minimum value and maximum value under the worst ambient temperature, supply voltage and clock frequency conditions.

Based on electrical characterization results, design simulations, and/or process parameters noted below the table, not tested in production. Minimum and maximum values are referenced to sample testing and averaged plus or minus three times the standard deviation.

5.1.2. Typical value

Unless otherwise specified, typical data is based on T_A = 25°C and V_{CC} = 3.3 V. These data are for design guidance only and have not been tested.

Typical ADC accuracy values are obtained by sampling a standard batch, tested under all temperature ranges, and 95% of the chip error is less than or equal to the given value.

5.2. Absolute maximum ratings

If the applied voltage exceeds the absolute maximum value given in the table below, it may cause permanent damage to the chip. Only the strength ratings that can be tolerated are listed here, and it does not imply that the functional operation of the device is correct under these conditions. Operating under maximum conditions for a long time may affect the reliability of the chip.

Table 5-1 Voltage characteristics ⁽¹⁾

Symbol	Describe	Minimum	Maximum	Unit
V _{CC}	External mains power supply	-0.3	6.25	V
V _{IN}	Input voltage of other pins	-0.3	V _{CC} +0.3	V

- Power supply V_{CC} and ground V_{SS} pins must always be connected to the external power supply within the allowable range.

Table 5-2 Current characteristics

Symbol	Describe	Maximum	Unit
I _{VCC}	Flowing into V _{CC} pin (supply current) ⁽¹⁾	100	mA
I _{VSS}	Total current flowing out of V _{SS} pin (outflow current) ⁽¹⁾	100	
I _{IO(PIN)}	Output sink current of COM IO	20	
	Source current for all IOs	- 20	

- Power supply V_{CC} and ground V_{SS} pins must always be connected to the external power supply within the allowable range.

Table 5-3 Temperature characteristics

Symbol	Describe	Condition	Value	Unit
T_{STG}	Storage temperature range		- 65 ~ + 150	°C
T_O	Range of operating temperature	x6 version	- 40 ~ + 85	°C
		x7 version	- 40 ~ + 105	°C

5.3. Operating conditions

5.3.1. General operating conditions

Table 5-4 General operating conditions

Symbol	Parameter	Condition	Minimum	Maximum	Unit
f_{HCLK}	Internal AHB clock frequency	-	0	32	MHz
f_{PCLK}	Internal APB Clock Frequency	-	0	32	MHz
V_{CC}	Standard operating voltage	x6 version	1.7	5.5	V
		x7 version	2.0	5.5	V
V_{IN}	IO input voltage	-	-0.3	$V_{CC}+0.3$	V
T_A	Ambient temperature	x6 version	-40	85	°C
		x7 version	-40	105	°C
T_J	Junction temperature	x6 version	-40	90	°C
		x7 version	-40	110	°C

5.3.2. Power on and down operating conditions

Table 5-5 Power on and Power down Operating Conditions

Symbol	Parameter	Condition	Minimum	Maximum	Unit
t_{VCC}	V_{CC} rise rate	-	0	∞	us/V
	V_{CC} fall rate	-	20	∞	

5.3.3. Embedded reset and LVD module features

Table 5-6 Embedded Reset Module Features

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
$t_{RSTTEMPO}^{(1)}$	Reset time	-	-	4.0	7.5	ms
$V_{POR/PDR}$	POR/PDR reset threshold	rising edge	1.50 ⁽²⁾	1.60	1.70	V
		falling edge	1.45 ⁽¹⁾	1.55	1.65 ⁽²⁾	V
V_{BOR1}	BOR threshold 1	rising edge	1.70 ⁽²⁾	1.80	1.90	V
		falling edge	1.60	1.70	1.80 ⁽²⁾	V
V_{BOR2}	BOR threshold 2	rising edge	1.90 ⁽²⁾	2.00	2.10	V

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
		falling edge	1.80	1.90	2.00 ⁽²⁾	V
VBOR3	BOR threshold 3	rising edge	2.10 ⁽²⁾	2.20	2.30	V
		falling edge	2.00	2.10	2.20 ⁽²⁾	V
VBOR4	BOR threshold 4	rising edge	2.30 ⁽²⁾	2.40	2.50	V
		falling edge	2.20	2.30	2.40 ⁽²⁾	V
VBOR5	BOR threshold 5	rising edge	2.50 ⁽²⁾	2.60	2.70	V
		falling edge	2.40	2.50	2.60 ⁽²⁾	V
VBOR6	BOR threshold 6	rising edge	2.70 ⁽²⁾	2.80	2.90	V
		falling edge	2.60	2.70	2.80 ⁽²⁾	V
VBOR7	BOR threshold 7	rising edge	2.90 ⁽²⁾	3.00	3.10	V
		falling edge	2.80	2.90	3.00 ⁽²⁾	V
VBOR8	BOR threshold 8	rising edge	3.10 ⁽²⁾	3.20	3.30	V
		falling edge	3.00	3.10	3.20 ⁽²⁾	V
VPVD0	PVD threshold 0	rising edge	1.70 ⁽²⁾	1.80	1.90	V
		falling edge	1.60	1.70	1.80 ⁽²⁾	V
VPVD1	PVD Threshold 1	rising edge	1.90 ⁽²⁾	2.00	2.10	V
		falling edge	1.80	1.90	2.00 ⁽²⁾	V
VPVD2	PVD Threshold 2	rising edge	2.10 ⁽²⁾	2.20	2.30	V
		falling edge	2.00	2.10	2.20 ⁽²⁾	V
VPVD3	PVD Threshold 3	rising edge	2.30 ⁽²⁾	2.40	2.50	V
		falling edge	2.20	2.30	2.40 ⁽²⁾	V

		falling edge	2.40	2.50	2.60 ⁽²⁾	V
VPVD5	PVD threshold 5	rising edge	2.70 ⁽²⁾	2.80	2.90	V
		falling edge	2.60	2.70	2.80 ⁽²⁾	V
VPVD6	PVD threshold 6	rising edge	2.90 ⁽²⁾	3.00	3.10	V
		falling edge	2.80	2.90	3.00 ⁽²⁾	V
VPVD7	PVD threshold 7	rising edge	3.10 ⁽²⁾	3.20	3.30	V
		falling edge	3.00	3.10	3.20 ⁽²⁾	V
VPOR_PDR_hyst ⁽¹⁾	POR / PDR hysteresis voltage	-		50		mV
VPVD_BOR_hyst ⁽¹⁾	PVD hysteresis voltage			100		mV
I _{DD(PVD)}	PVD power consumption			0.6		uA
I _{DD(BOR)}	BOR power consumption			0.6		uA

- Guaranteed by design, not tested in production.
- Data is based on assessment results and is not tested in production.

5.3.4. Operating current characteristics

Table 5-7 Run mode current

Symbol	Condition						Typical ⁽¹⁾	Maxi- mum	Unit
	System clock	Frequency	Code	Run	Peripheral clock	FLASH sleep			
I _{DD(run)}	HSI	24 MHz	While ⁽¹⁾	Flash	ON	DISABLE	1.5	-	mA
					OFF	DISABLE	0.9	-	

Symbol	Condition						Typical (1)	Maximum	Unit
	System clock	Frequency	Code	Run	Peripheral clock	FLASH sleep			
	16 MHz				ON	DISABLE	1.1	-	uA
					OFF	DISABLE	0.7	-	
					ON	DISABLE	0.7	-	
					OFF	DISABLE	0.5	-	
	8 MHz				ON	DISABLE	0.5	-	
					OFF	DISABLE	0.35	-	
					ON	DISABLE	170	-	
	4 MHz				OFF	DISABLE	170	-	
					ON	ENABLE	95	-	
	LSI	32.768 kHz			OFF	ENABLE	95	-	
					ON	ENABLE	95	-	

1. Data is based on assessment results and is not tested in production.

Table 5-8 Sleep mode current

Symbol	Condition				Typical (1)	Maximum	Unit
	System clock	Frequency	Peripheral clock	FLASH sleep			
$I_{DD}(\text{sleep})$	HSI	24 MHz	ON	DISABLE	1	-	mA
			OFF	DISABLE	0.6	-	mA
		16 MHz	ON	DISABLE	0.75	-	mA
			OFF	DISABLE	0.5	-	mA
		8 MHz	ON	DISABLE	0.5	-	mA
			OFF	DISABLE	0.35	-	mA
		4 MHz	ON	DISABLE	0.4	-	mA
			OFF	DISABLE	0.35	-	mA
	LSI	32.768 kHz	ON	DISABLE	170	-	uA
			OFF	DISABLE	170	-	uA
	LSI	32.768 kHz	ON	ENABLE	95	-	uA
			OFF	ENABLE	96	-	uA

1. Data is based on assessment results and is not tested in production.

Table 5-9 Stop mode current

Symbol	Condition					Typical (1)	Maximum	Unit
	V_{CC}	V_{DD}	MR/ LPR	LSI	Peripheral clock			
$I_{DD}(\text{stop})$	$V_{CC}=1.7 \text{ V} \sim 5.5 \text{ V}$	1.2 V	MR	-	-	70	-	uA
		1.2 V	LPR	ON	RTC+IWDG+LP TIM	6	-	
					IWDG	6	-	
					LPTIM	6	-	
					RTC	6	-	
				OFF	No	6	-	

Symbol	Condition					Typical ⁽¹⁾	Maximum	Unit
	V _{CC}	V _{DD}	MR/ LPR	LSI	Peripheral clock			
	1.0 V	ON	RTC+IWDG+LP TIM	RTC+IWDG+LP TIM	4.5	-	-	-
				IWDG	4.5	-	-	-
				LPTIM	4.5	-	-	-
				RTC	4.5	-	-	-
			OFF	No	4.5	-	-	-

1. Data is based on assessment results and is not tested in production.

5.3.5. Low power mode wake-up time

Table 5-10 Low power mode wake-up time

Symbol	Parameters ⁽¹⁾		Condition	Typical ⁽²⁾	maximum	Unit
T _{WUSLEEP}	Wake-up time from sleep		-	1.65		us
T _{WUSTOP}	Wake-up time from stop	Powered by MR	Execute program in Flash, HSI (24 Mhz) as system clock	3.5		us
		Powered by LPR	Execute program in Flash, HSI as sys- tem clock	6		us
			V _{DD} =1.2 V	6		

- The wake-up time is measured from the wake-up time until the first instruction is read by the user program.
- Data is based on assessment results and is not tested in production.

5.3.6. External clock source characteristics

5.3.6.1. External high-speed clock

In the bypass mode of HSE (the HSEBYP of RCC_CR is set), when the high-speed start-up circuit in the chip stops working, the corresponding IO is used as a standard GPIO.

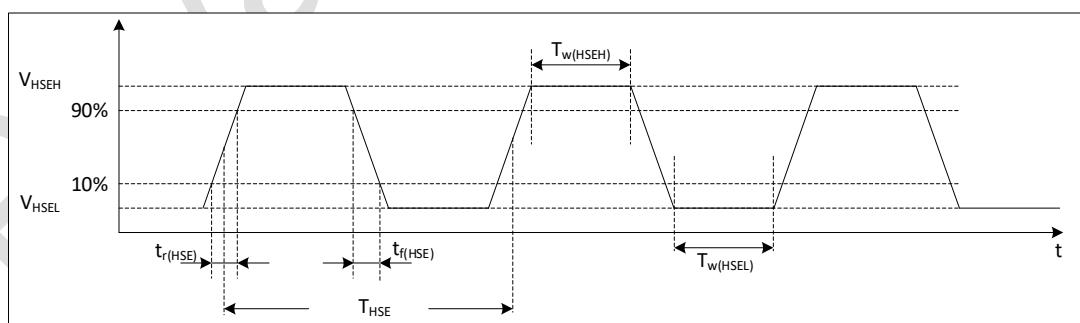

Figure 5-1 External high-speed clock timing diagram

Table 5-11 External high-speed clock features

Symbol	Parameters ⁽¹⁾	Minimum	Typical	Maximum	Unit
f _{HSE_ext}	User external clock frequency	0	8	32	MHz
V _{HSEH}	Input pin high level voltage	0.7V _{CC}		V _{CC}	V

Symbol	Parameters ⁽¹⁾	Minimum	Typical	Maximum	Unit
V _{HSEL}	Input pin low level voltage	V _{ss}		0.3V _{cc}	
t _{W(HSEH)} t _{W(HSEL)}	Enter high or low time	1.5			ns
t _{r(HSE)} t _{f(HSE)}	Enter the rise/fall time	-		20	ns

1. Guaranteed by design, not tested in production.

5.3.6.2. External high-speed crystal

An external 4~32 MHz crystal/ceramic resonator. In the application, the crystal and load capacitors should be as close as possible to the pins to minimize output distortion and start-up settling time.

Table 5-12 External high-speed crystal characteristics

Symbol	Parameter	Condition ⁽¹⁾	Minimum ⁽²⁾	Typical	Maximum ⁽²⁾	Unit
f _{osc_IN}	Oscillation frequency	-	4		32	MHz
I _{DD} ⁽⁴⁾	HSE power consumption	During startup			5.5	mA
		V _{cc} =3 V, R _m =30 Ω, C _L =10 pF@8 MHz		0.58		
		V _{cc} =3 V, R _m =45Ω, C _L =10 pF@8 MHz		0.59		
		V _{cc} =3 V, R _m =30Ω, C _L =5 pF@32MHz		0.89		
		V _{cc} =3 V, R _m =30Ω, C _L =10 pF@32 MHz		1.10		
		V _{cc} =3 V, R _m =30Ω, C _L =20 pF@32 MHz		1.90		
t _{su} (HSE) (3) (4)	Start Time	f _{osc_IN} =32 MHz		3		ms
		f _{osc_IN} =4 MHz		15		ms

- Crystal/ceramic resonator characteristics are based on the manufacturer datasheet.
- Guaranteed by design, not tested in production.
- t_{su(HSE)} is the start-up time from enable (by software) to the clock oscillation reaches stability, measured for a standard crystal/resonator, which can vary greatly from one crystal/resonator to another .
- Data is based on assessment results and is not tested in production.

5.3.7. Internal high frequency clock source HSI characteristics

Table 5-13 Internal high frequency clock source characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
f _{HSI}	HSI frequency	T _A =25°C, V _{cc} =3.3 V	23.83 ⁽²⁾	24	24.17 ⁽²⁾	MHz
			21.97 ⁽²⁾	22.12	22.27 ⁽²⁾	MHz
			15.89 ⁽²⁾	16	16.11 ⁽²⁾	MHz
			7.94 ⁽²⁾	8	8.06 ⁽²⁾	MHz
			3.97 ⁽²⁾	4	4.03 ⁽²⁾	MHz

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
$\Delta_{\text{Temp(HSI)}}$	HSI frequency temperature drift	$T_A=0 \sim 85^\circ\text{C}$	-2 ⁽²⁾		2 ⁽²⁾	%
		$T_A=-40 \sim 85^\circ\text{C}$	-4 ⁽²⁾		2 ⁽²⁾	%
		$T_A=-40 \sim 105^\circ\text{C}$	-4 ⁽²⁾		2.5 ⁽²⁾	%
$f_{\text{TRIM}}^{(1)}$	HSI fine-tuning accuracy			0.1		%
$D_{\text{HSI}}^{(1)}$	Duty cycle		45 ⁽¹⁾		55 ⁽¹⁾	%
$t_{\text{Stab(HSI)}}$	HSI stabilization time			2	4 ⁽¹⁾	us
$I_{\text{DD(HSI)}}^{(2)}$	HSI power consumption	4 MHz		100		uA
		8 MHz		105		uA
		16 MHz		150		uA
		22.12 MHz, 24 MHz		180		uA

- Guaranteed by design, not tested in production.
- Data is based on assessment results and is not tested in production.

5.3.8. Internal low frequency clock source LSI characteristics

Table 5-14 Internal low frequency clock characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
f_{LSI}	LSI frequency	$T_A=25^\circ\text{C}, V_{\text{CC}}=3.3\text{V}$	-1		+1	%
$\Delta_{\text{Temp(LSI)}}$	LSI frequency temperature drift	$T_A=0 \sim 70^\circ\text{C}$	-10 ⁽²⁾		10 ⁽²⁾	%
		$T_A=-40 \sim 105^\circ\text{C}$	-20 ⁽²⁾		20 ⁽²⁾	%
$f_{\text{TRIM}}^{(1)}$	LSI fine-tuning accuracy			0.2		%
$t_{\text{Stab(LSI)}}^{(1)}$	LSI stabilization time			150		us
$I_{\text{DD(LSI)}}^{(1)}$	LSI power consumption			210		nA

- Guaranteed by design, not tested in production.
- Data is based on assessment results and is not tested in production.

5.3.9. Memory characteristics

Table 5-15 Memory characteristics

Symbol	Parameter	Condition	Typical	Maximum ⁽¹⁾	Unit
t_{prog}	Page program	-	1.0	1.5	ms
t_{ERASE}	Page/sector/mass erase	-	3.0	4.5	ms
I_{DD}	Page programme		2.1	2.9	mA
	Page/sector/mass erase		2.1	2.9	mA

- Guaranteed by design, not tested in production.

Table 5-16 Memory erase times and data retention

Symbol	Parameter	Condition	Minimum ⁽¹⁾	Unit
N_{END}	Erase and write times	$T_A = -40 \sim 105^\circ\text{C}$	100	kcycle

Symbol	Parameter	Condition	Minimum ⁽¹⁾	Unit
t _{RET}	Data retention period	10 kcycle T _A = 55°C	20	Year

1. Data is based on assessment results and is not tested in production.

5.3.10. EFT characteristics

Table 5-17 EFT characteristics

Symbol	Parameter	Condition	Grade	Typical	Unit
EFT to IO	-	IEC61000-4-4	B	2	kV
EFT to Power	-	IEC61000-4-4	B	4	kV

5.3.11. ESD & LU Characteristics

Table 5-18 ESD & LU characteristics

Symbol	Parameter	Condition	Typical	Unit
V _{ESD(HBM)}	Static Discharge Voltage (human body model)	ESDA/JEDEC JS-001-2017	6	kV
V _{ESD(CDM)}	Static Discharge Voltage (charging equipment model)	ESDA/JEDEC JS-002-2018	1	kV
V _{ESD(MM)}	Static discharge voltage (machine model)	JESD22-A115C	200	V
LU	Static Latch-Up	JESD78E	200	mA

5.3.12. Port characteristics

Table 5-19 IO static characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V _{IH}	Input high level voltage	T _A = -40 ~ 105°C	0.7V _{CC}			V
V _{IL}	Input low level voltage	T _A = -40 ~ 105°C			0.3V _{CC}	V
V _{hys⁽¹⁾}	Schmitt hysteresis voltage			200		mV
I _{lk_g}	Input leakage current				1	uA
R _{PU}	Pull-up resistor		30	50	70	kΩ
R _{PD}	Pull-down resistor		30	50	70	kΩ
C _{IO⁽¹⁾}	Pin capacitance			5		pF

1. Guaranteed by design, not tested in production.

Table 5-20 Output Voltage Characteristics

symbol	Parameters ⁽¹⁾	condition	Minimum	Maximum	unit
V _{OL}	COM IO output low level	I _{OL} = 8 mA, V _{CC} ≥ 2.7 V	-	0.4	V
		I _{OL} = 4 mA, V _{CC} = 1.8 V	-	0.5	V
V _{OH}	COM IO output high level	I _{OH} = 8 mA, V _{CC} ≥ 2.7 V	V _{CC} -0.4	-	V
		I _{OH} = 4 mA, V _{CC} = 1.8 V	V _{CC} -0.5	-	V

1. IO types can refer to the terms and symbols defined by the pins.

5.3.13. NRST pin characteristics

Table 5-21 NRST pin characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V_{IH}	Input high level voltage	$T_A = -40 \sim 105^\circ C$	$0.7V_{CC}$			V
V_{IL}	Input low level voltage	$T_A = -40 \sim 105^\circ C$			$0.2V_{CC}$	V
$V_{hys}^{(1)}$	Schmitt hysteresis voltage			300		mV
I_{Ikg}	Input leakage current				1	uA
$R_{PU}^{(1)}$	Pull-up resistor		30	50	70	kΩ
$R_{PD}^{(1)}$	Pull-down resistor		30	50	70	kΩ
C_{IO}	Pin capacitance			5		pF

1. Guaranteed by design, not tested in production.

5.3.14. ADC characteristics

Table 5-22 ADC characteristics

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
I_{DD}	Power consumption	@0.75 MSPS		1.0		mA
$C_{IN}^{(1)}$	Internal sample and hold capacitors			5		pF
F_{ADC}	Convert clock frequency	$V_{CC}=1.7 \sim 2.3 V$	1	4	$6^{(2)}$	MHz
		$V_{CC}=2.3 \sim 5.5 V$	1	8	$12^{(2)}$	MHz
$t_{samp}^{(1)}$		$V_{CC}=1.7 \sim 2.3 V$	0.2			us
		$V_{CC}=2.3 \sim 5.5 V$	0.1			us
$T_{conv}^{(1)}$				12^*T_{Clk}		
$T_{EOC}^{(1)}$				0.5^*T_{Clk}		
$DNL^{(2)}$				± 2		LSB
$INL^{(2)}$				± 3		LSB
$Offset^{(2)}$				± 2		LSB

1. Guaranteed by design, not tested in production.
2. Data is based on assessment results and is not tested in production.

5.3.15. Comparator characteristics

Table 5-23 Comparator characteristics ⁽¹⁾

Symbol	Parameter	Condition	Minimum	Typical	Maximum	Unit
V_{IN}	Input voltage range		0		V_{CC}	V
V_{BG}	Scale input voltage			V_{REFINT}		V
V_{SC}	Scaler offset voltage			± 5	± 10	mV
$I_{DD(SCALER)}$		$BRG_EN=0$ (bridge disable)		200	300	nA

Symbol	Parameter	Condition		Minimum	Typical	Maximum	Unit
	Scaler static consumption	BRG_EN=1(bridge enable)			0.8	1	uA
t _{START_SCALER}	Scaler startup time				100	200	us
t _{START}	Startup time to reach propagation delay specification	High-speed mode				5	us
		Medium-speed mode				15	
t _D	Propagation delay	200 mV step;	High-speed mode		30	50	ns
		100 mV overdrive	Medium-speed mode		0.3	0.6	us
		>200 mV step; 100 mV overdrive	High-speed mode			10	us
			Medium-speed mode			1.2	ns
V _{offset}	Offset error				±5		mV
V _{hys}	hysteresis	No hysteresis			0		mV
		Low hysteresis			10		
		Medium hysteresis			20		
		High hysteresis			30		
I _{DD}	consumption	Medium-speed mode; No deglitcher	Static		5		uA
			With 50 kHz and ±100 mv overdrive square signal		6		uA
		Medium-speed mode With deglitcher	Static		7		uA
			With 50 kHz and ±100 mv overdrive square signal		8		uA
		High-speed mode; No deglitcher	Static		250		uA
			With 50 kHz and ±100 mv overdrive square signal		250		uA

1. Guaranteed by design, not tested in production.

5.3.16. Temperature sensor characteristics

Table 5-24 Temperature sensor characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Unit
T _L ⁽¹⁾	VTS linearity with temperature		±1	±2	°C
Avg_Slope ⁽¹⁾	Average slope	2.3	2.5	2.7	mV/°C
V ₃₀	Voltage at 30°C(±5°C)	0.742	0.76	0.785	V
t _{START} ⁽¹⁾	Start-up time entering in continuous mode		70	120	us
t _{S_temp} ⁽¹⁾	ADC sampling time when reading the temperature	9			us

1. Guaranteed by design, not tested in production.

5.3.17. Internal reference voltage characteristics

Table 5-25 Internal reference voltage characteristics

Symbol	Parameter	Minimum	Typical	Maximum	Unit
V_{REFINT}	Internal reference voltage	1.17	1.2	1.23	V
$t_{start_vrefint}$	Start time of internal reference voltage		10	15	us
T_{coeff}	Temperature coefficient			100 ⁽¹⁾	ppm/°C
I_{VCC}	Current consumption from V _{CC}		12	20	uA

5.3.18. Timer characteristics

Table 5-26 Timer characteristics

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$t_{res(TIM)}$	Timer resolution time	-	1		$t_{TIMxCLK}$
		$f_{TIMxCLK} = 32$ MHz	20.833		ns
f_{EXT}	Timer external clock frequency on CH1 to CH4	-		$f_{TIMxCLK}/2$	MHz
		$f_{TIMxCLK} = 32$ MHz		24	
R_{ESTIM}	Timer resolution	TIM1/3/14/16/17		16	Bit
$t_{COUNTER}$	16-bit counter clock period		1	65536	$t_{TIMxCLK}$
		$f_{TIMxCLK} = 32$ MHz	0.020833	1365	us

Table 5-27LPTIM characteristics (clock selection LSI)

Prescaler	PRESC[2:0]	Minimum overflow	Maximum overflow	Unit
/1	0	0.0305	1998.848	ms
/2	1	0.0610	3997.696	
/4	2	0.1221	8001.9456	
/8	3	0.2441	15997.3376

/64	6	1.9531	127998.3616	
/128	7	3.9063	256003.2768	

Table 5-28IWDG characteristics (clock selection LSI)

Prescaler	PR[2:0]	Minimum overflow	Maximum overflow	Unit
/4	0	0.122	499.712	ms
/8	1	0.244	999.424	
/16	2	0.488	1998.848	

Prescaler	PR[2:0]	Minimum overflow	Maximum overflow	Unit
/32	3	0.976	3997.696	
/64	4	1.952	7995.392	
/128	5	3.904	15990.784	
/256	6 or 7	7.808	31981.568	

Table 5-29 WWDG characteristics (clock select 32 MHz PCLK)

Prescaler	WDGTB[1:0]	Minimum overflow	Maximum overflow value	Unit
1*4096	0	0.085	5.461	ms
2*4096	1	0.171	10.923	
4*4096	2	0.341	21.845	
8*4096	3	0.683	43.691	

5.3.19. Communication port characteristics

5.3.19.1. I²C bus interface features

I²C interface meets the requirements of the I²C -bus specification and user manual :

- Standard-mode(Sm): 100 kbit/s
- Fast-mode(Fm): 400 kbit/s

Timing is guaranteed by design, provided the I²C peripheral is properly configured and the I²C CLK frequency is greater than the minimum required in the table below.

Table 5-30 Minimum I²C CLK frequency

Symbol	Parameter	Condition	Minimum	Unit
$f_{I2CCLK(min)}$	Minimum I ² C CLK frequency	Standard-mode	2	MHz
		Fast-mode	9	

I²C SDA and SCL pins have analog filtering, see table below.

Table 5-31 I²C filter characteristics

Symbol	Parameter	Minimum	Maximum	Unit
t_{AF}	Limiting duration of spikes suppressed by the filter (Spikes shorter than the limiting duration are suppressed)	50	260	ns

5.3.19.2. Serial Peripheral Interface SPI Characteristics

Table 5-32 SPI characteristics

Symbol	Parameter	Condition	Minimum	Maximum	Unit
f_{SCK} $1/t_{c(SCK)}$	SPI clock frequency	Master mode	-	12	MHz
		Slave mode	-	12	
$t_{r(SCK)}$ $t_{f(SCK)}$	SPI clock rise and fall time	Capacitive load: C = 15 pF	-	6	ns
$t_{su(NSS)}$	NSS setup time	Slave mode	4T _{pclk}	-	ns

Symbol	Parameter	Condition	Minimum	Maximum	Unit
$t_{h(NSS)}$	NSS hold time	Slave mode	$2Tpclk + 10$	-	ns
$t_{w(SCKH)}$ $t_{w(SCKL)}$	SCK high and low time	Master mode, $f_{PCLK} = 36$ MHz, presc = 4	$Tpclk^*2 - 2$	$Tpclk^*2 + 1$	ns
$t_{su(MI)}$ $t_{su(SI)}$	Data input setup time	Master mode, $f_{PCLK} = 48$ MHz, presc = 4	$Tpclk+5^{(1)}$	-	ns
		Slave mode, $f_{PCLK} = 48$ MHz, presc = 4	5	-	
$t_{h(MI)}$	Data input hold time	Master mode	5	-	ns
$t_{h(SI)}$		Slave mode	$Tpclk+5$	-	
$t_a(SO)$	Data output access time	Slave mode, presc = 4	0	$3Tpclk$	ns
$t_{dis(SO)}$	Data output disable time	Slave mode	$2Tpclk+5$	$4Tpclk+5$	ns
$t_v(SO)$	Data output valid time	Slave mode (after enable edge), presc = 4	0	$1.5Tpclk^{(2)}$	ns
$t_v(MO)$	Data output valid time	Master mode (after enable edge)	-	6	ns
$t_{h(SO)}$	Data output hold time	Slave mode, presc = 4	$0^{(3)}$	-	ns
$t_{h(MO)}$		Master mode	2	-	
DuCy(SCK)	SPI slave input clock duty cycle	Slave mode	45	55	%

1. The Master generates 1 pclk to receive control signal before the receive edge.
 2. Slave has a maximum of 1 PCLK based on the sending edge of SCK delay, considering IO delay, etc., define 1.5 PCLK.
 3. In the case that the SCK duty cycle sent by the Master is wide between the receiving edge and the sending edge, the Slave updates the data before the sending edge.

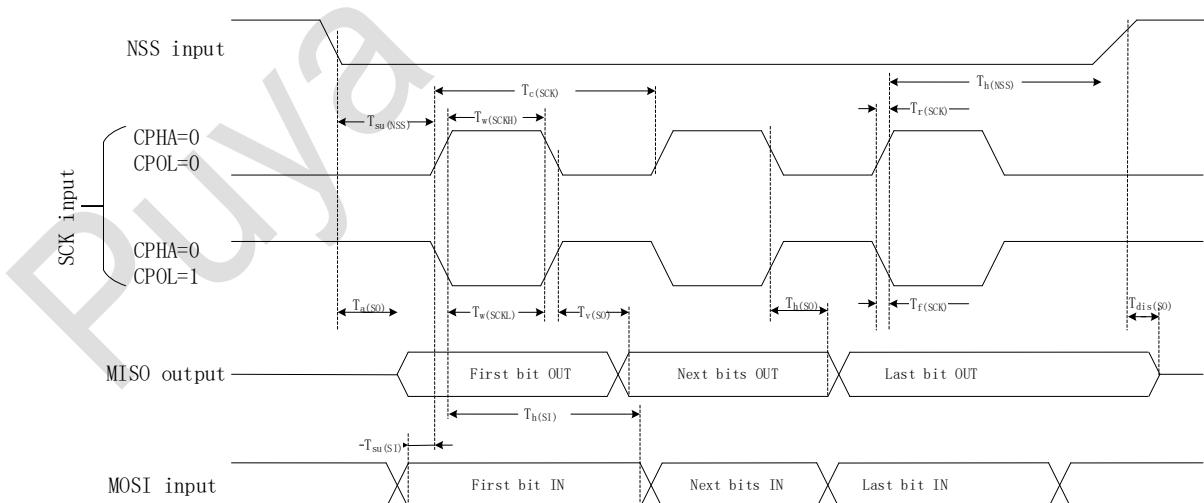

Figure 5-2 SPI timing diagram – slave mode and CPHA=0

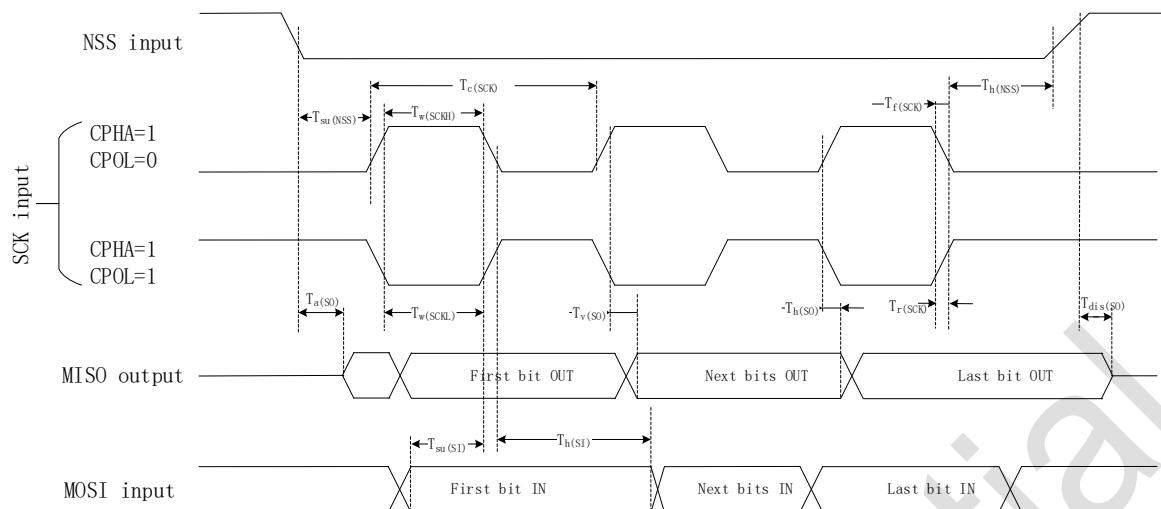

Figure 5-3 SPI timing diagram – slave mode and CPHA=1

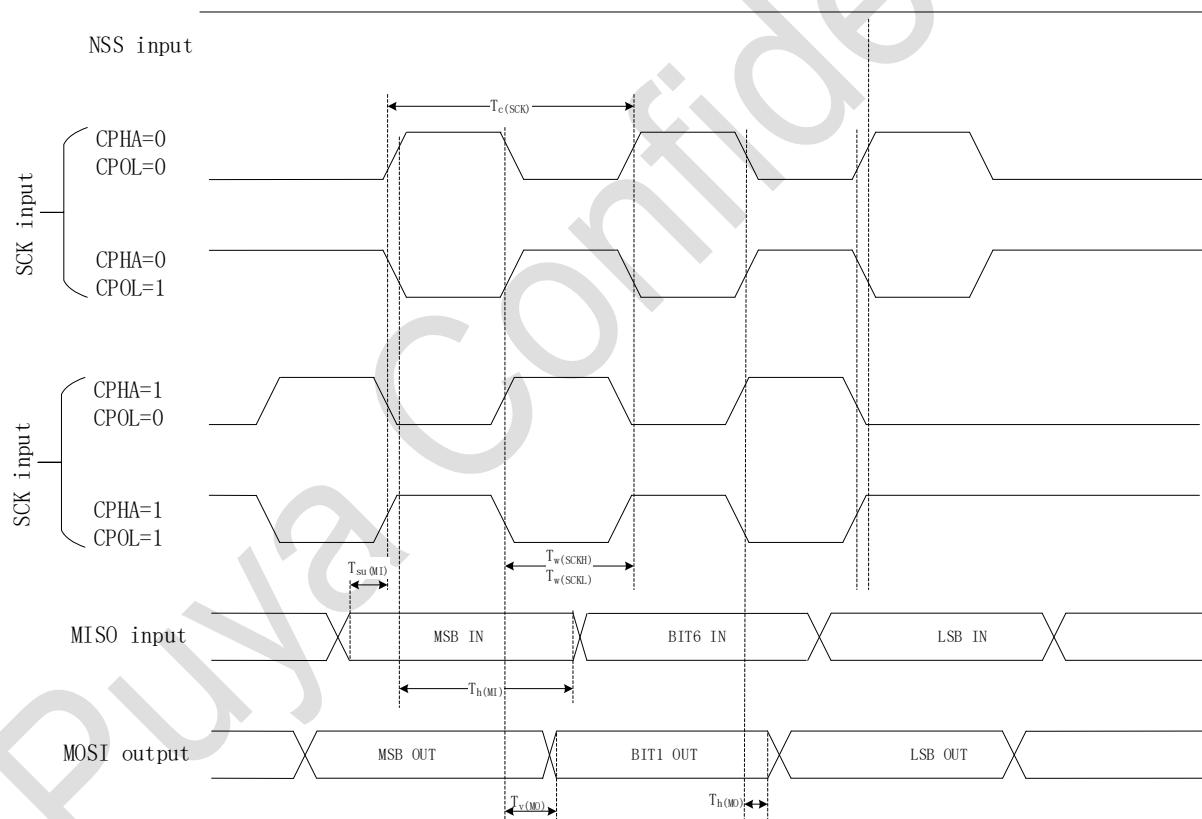

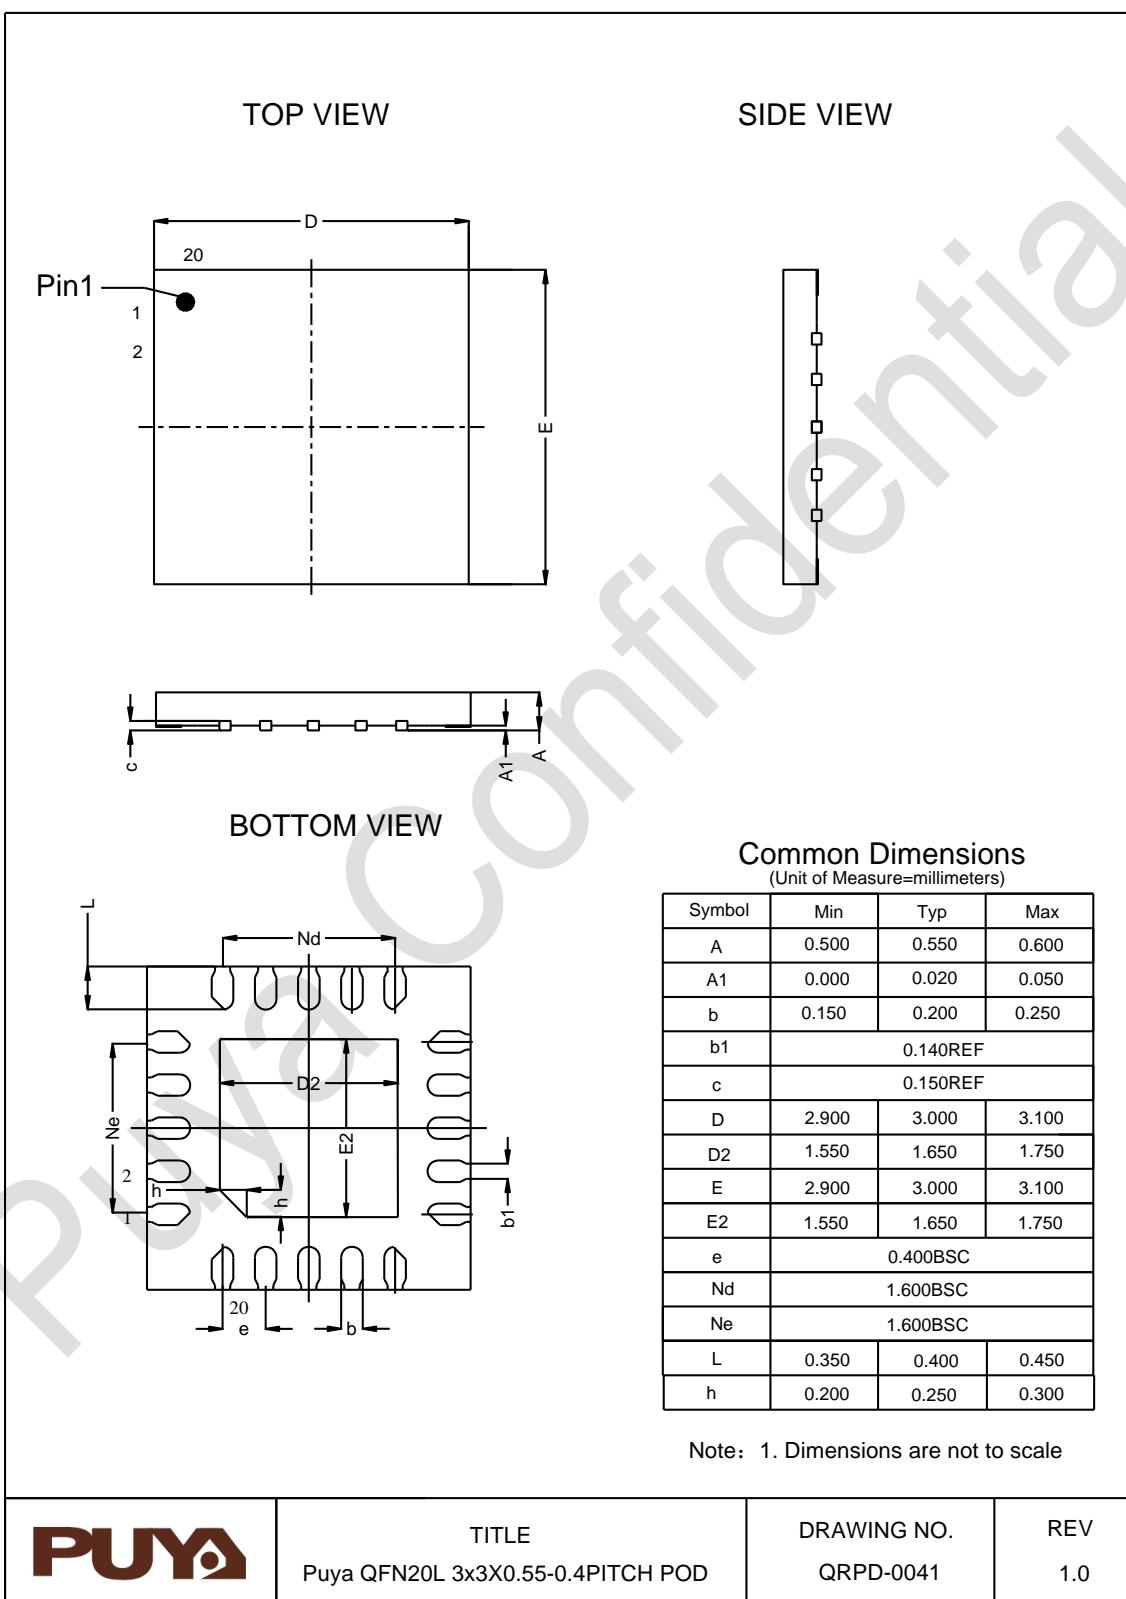

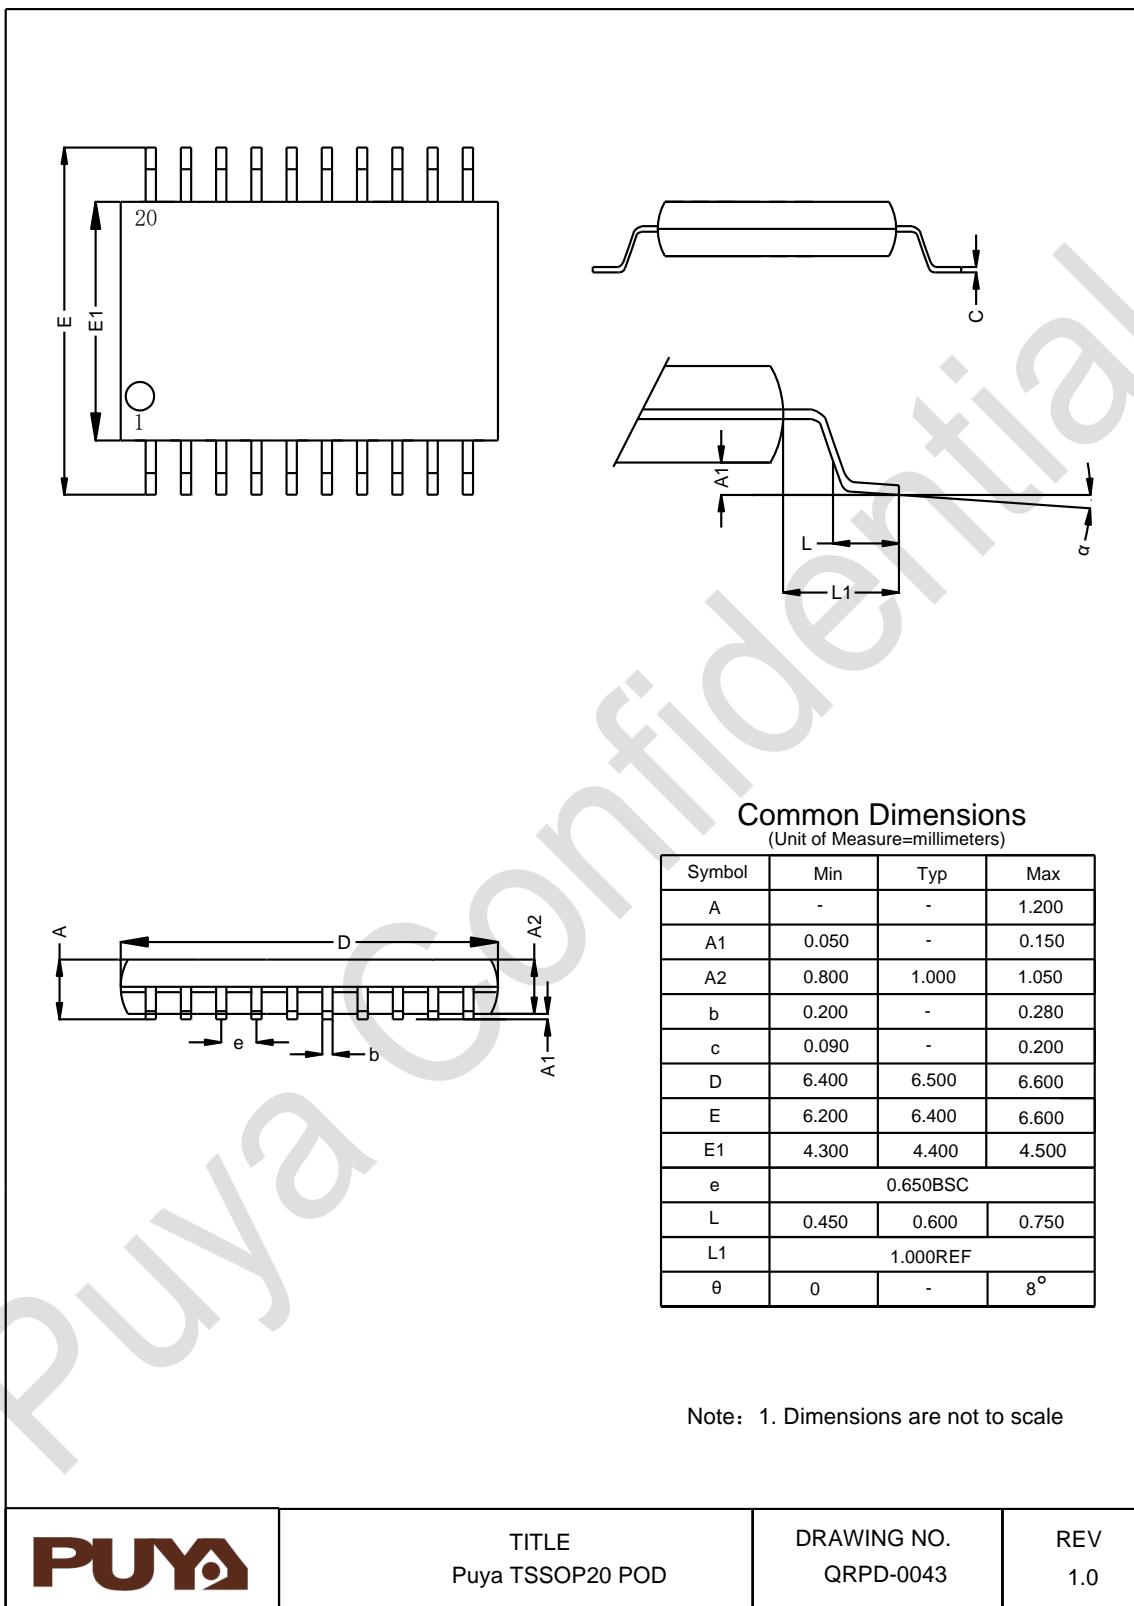

Figure 5-4 SPI timing diagram – master mode

6. Package information

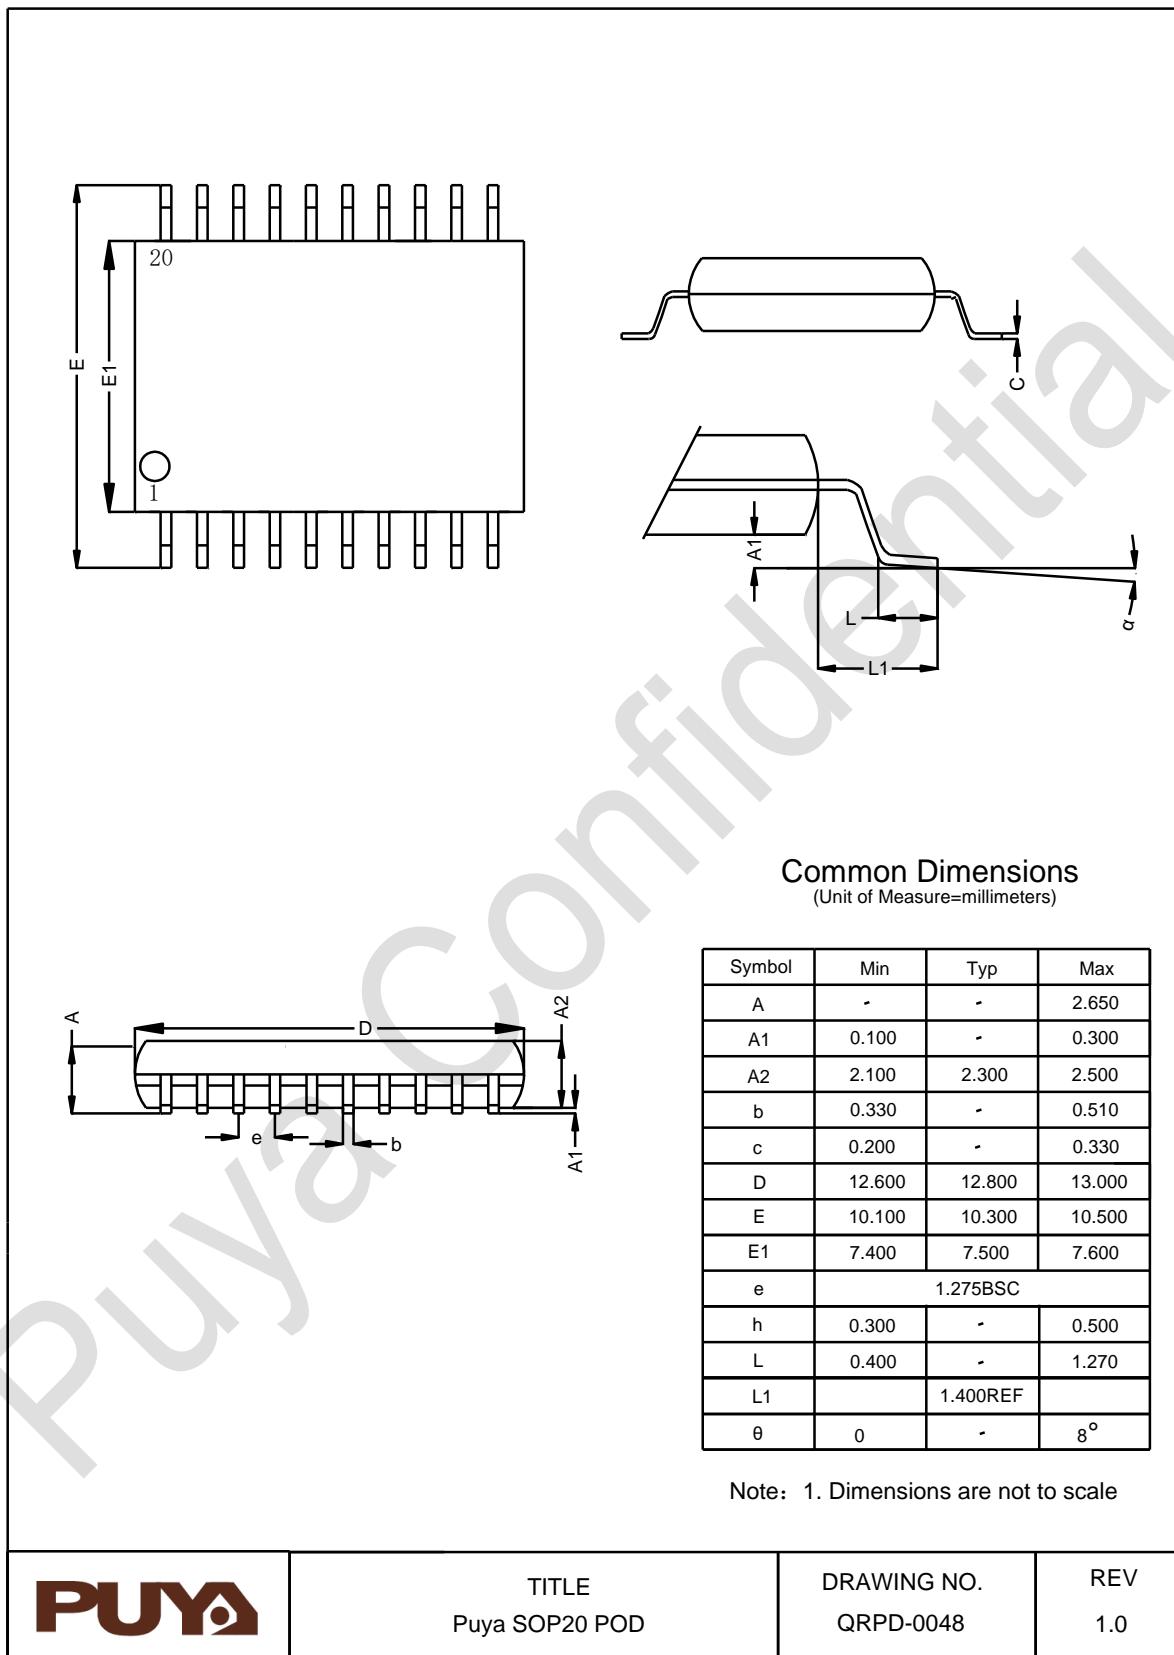

6.1. QFN20

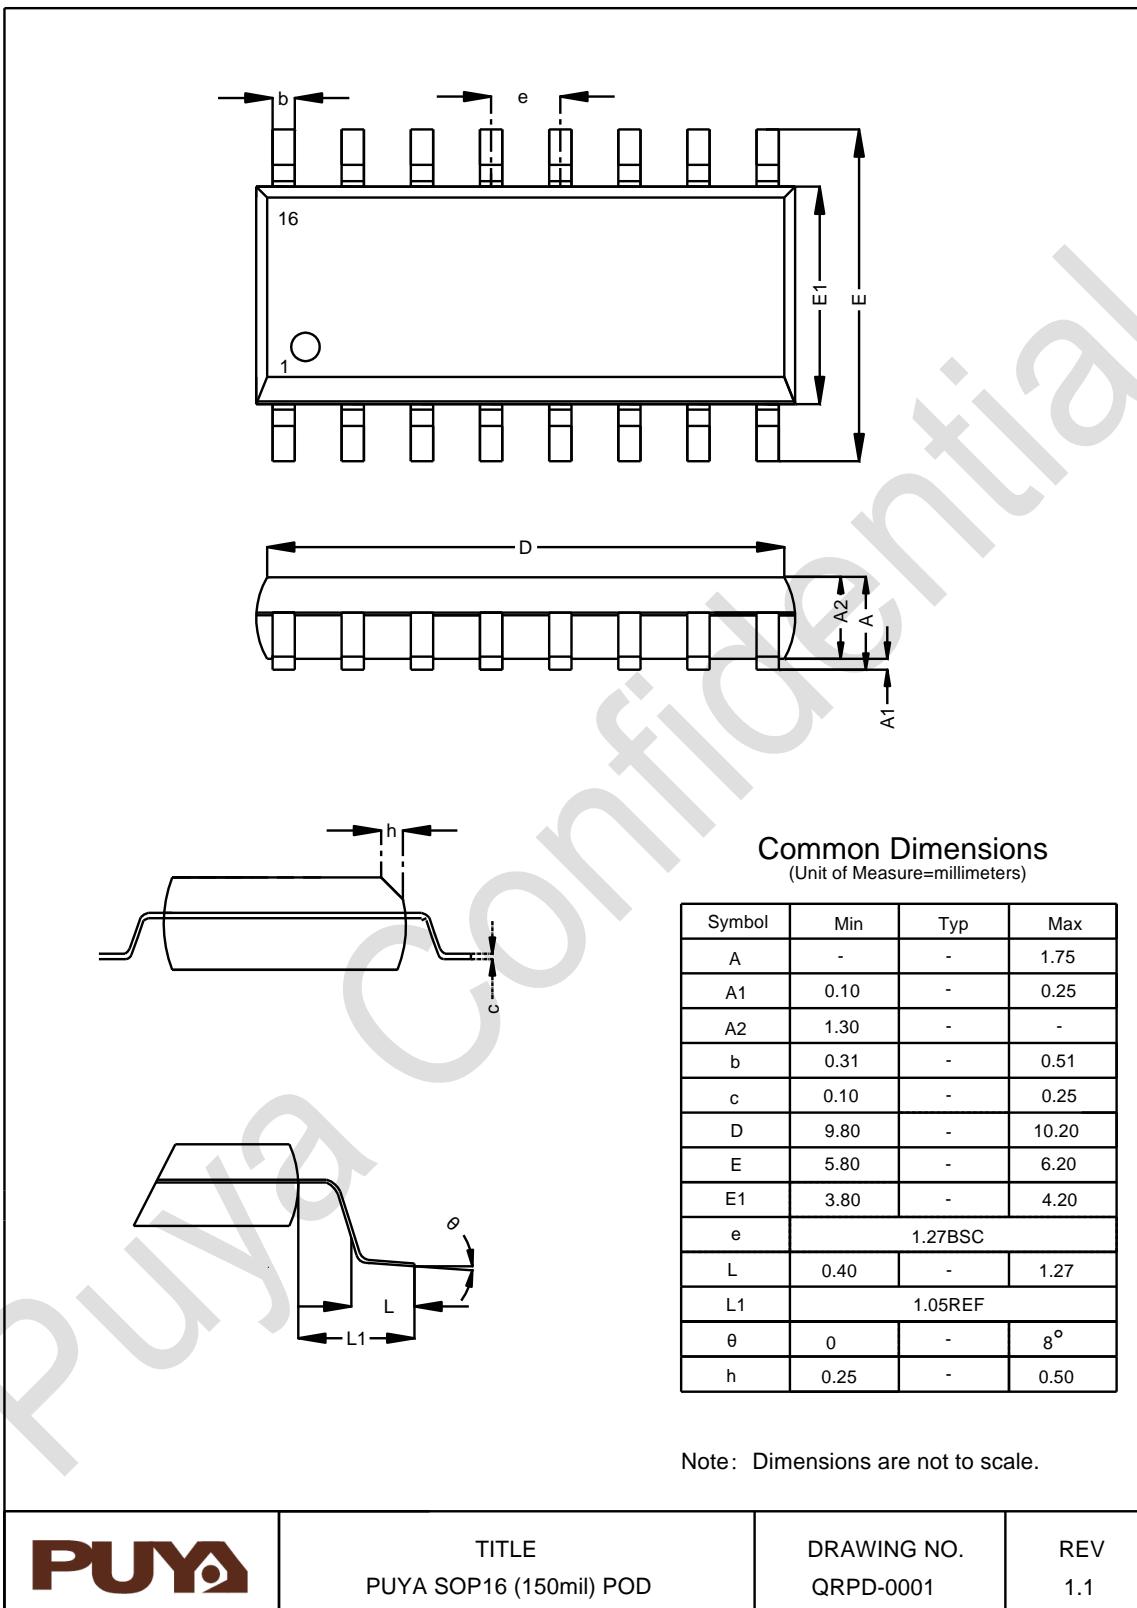

6.2. TSSOP20

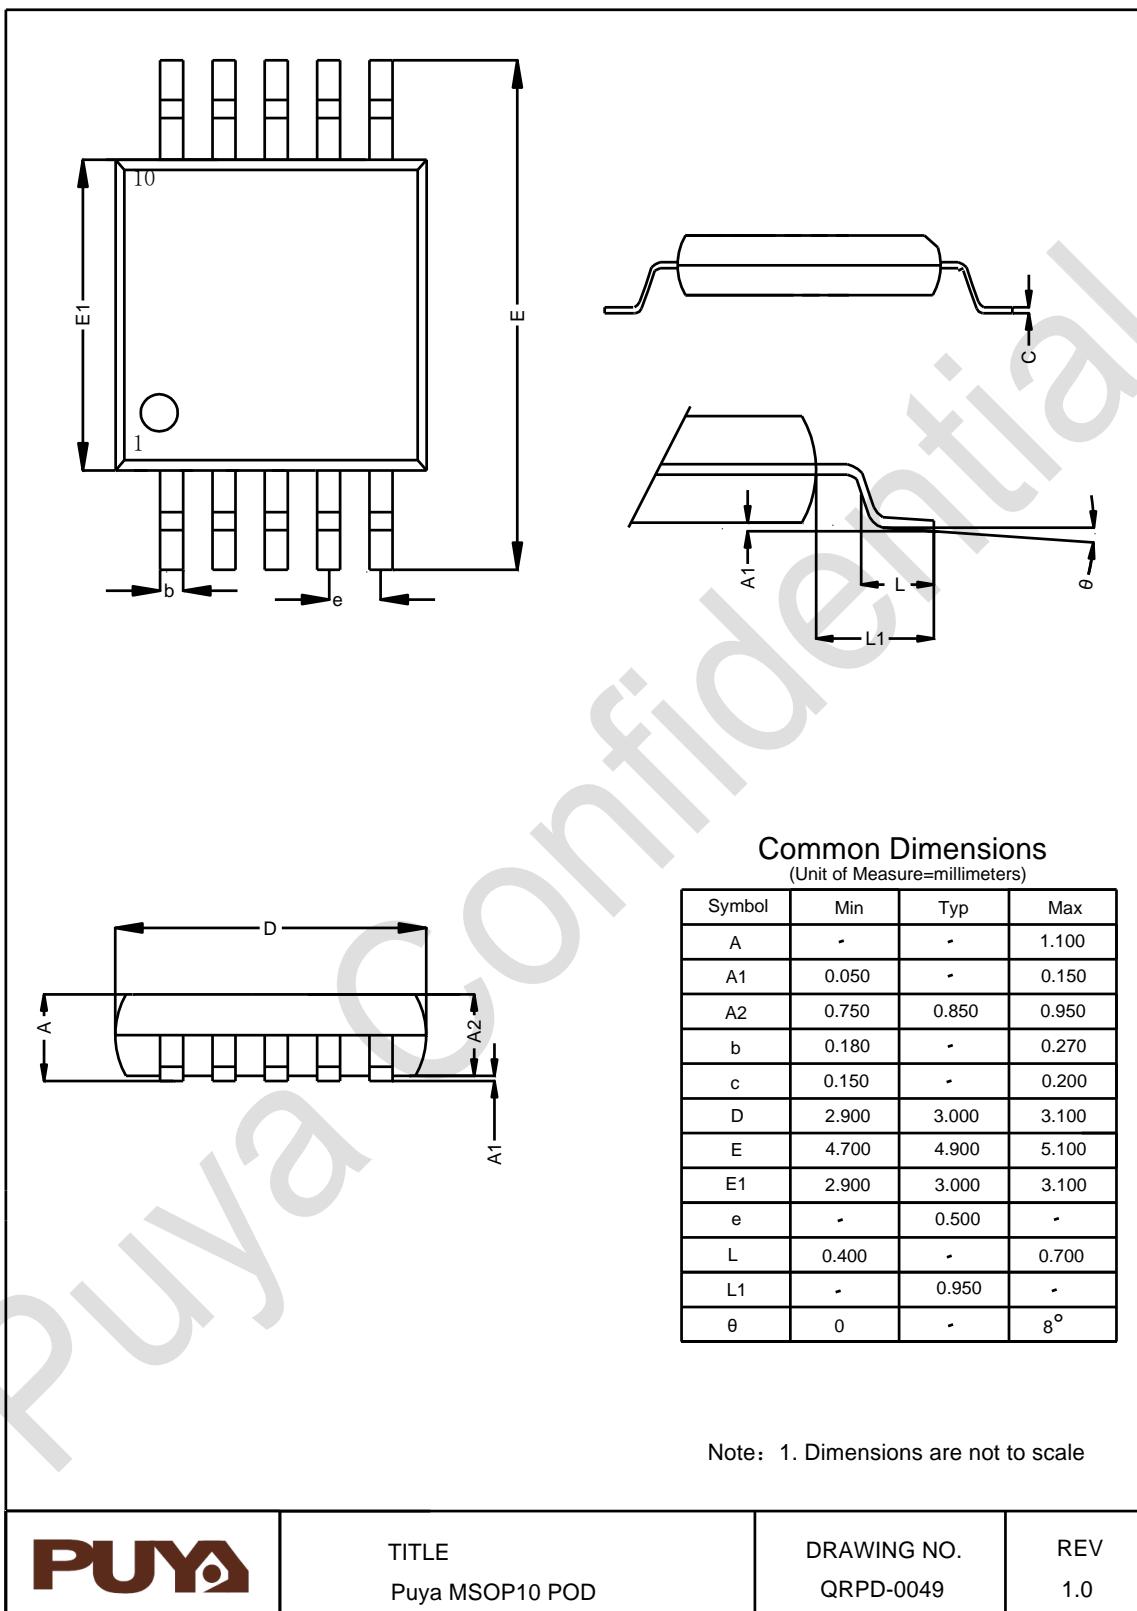

6.3. SOP20

6.4. SOP16

6.5. MSOP10

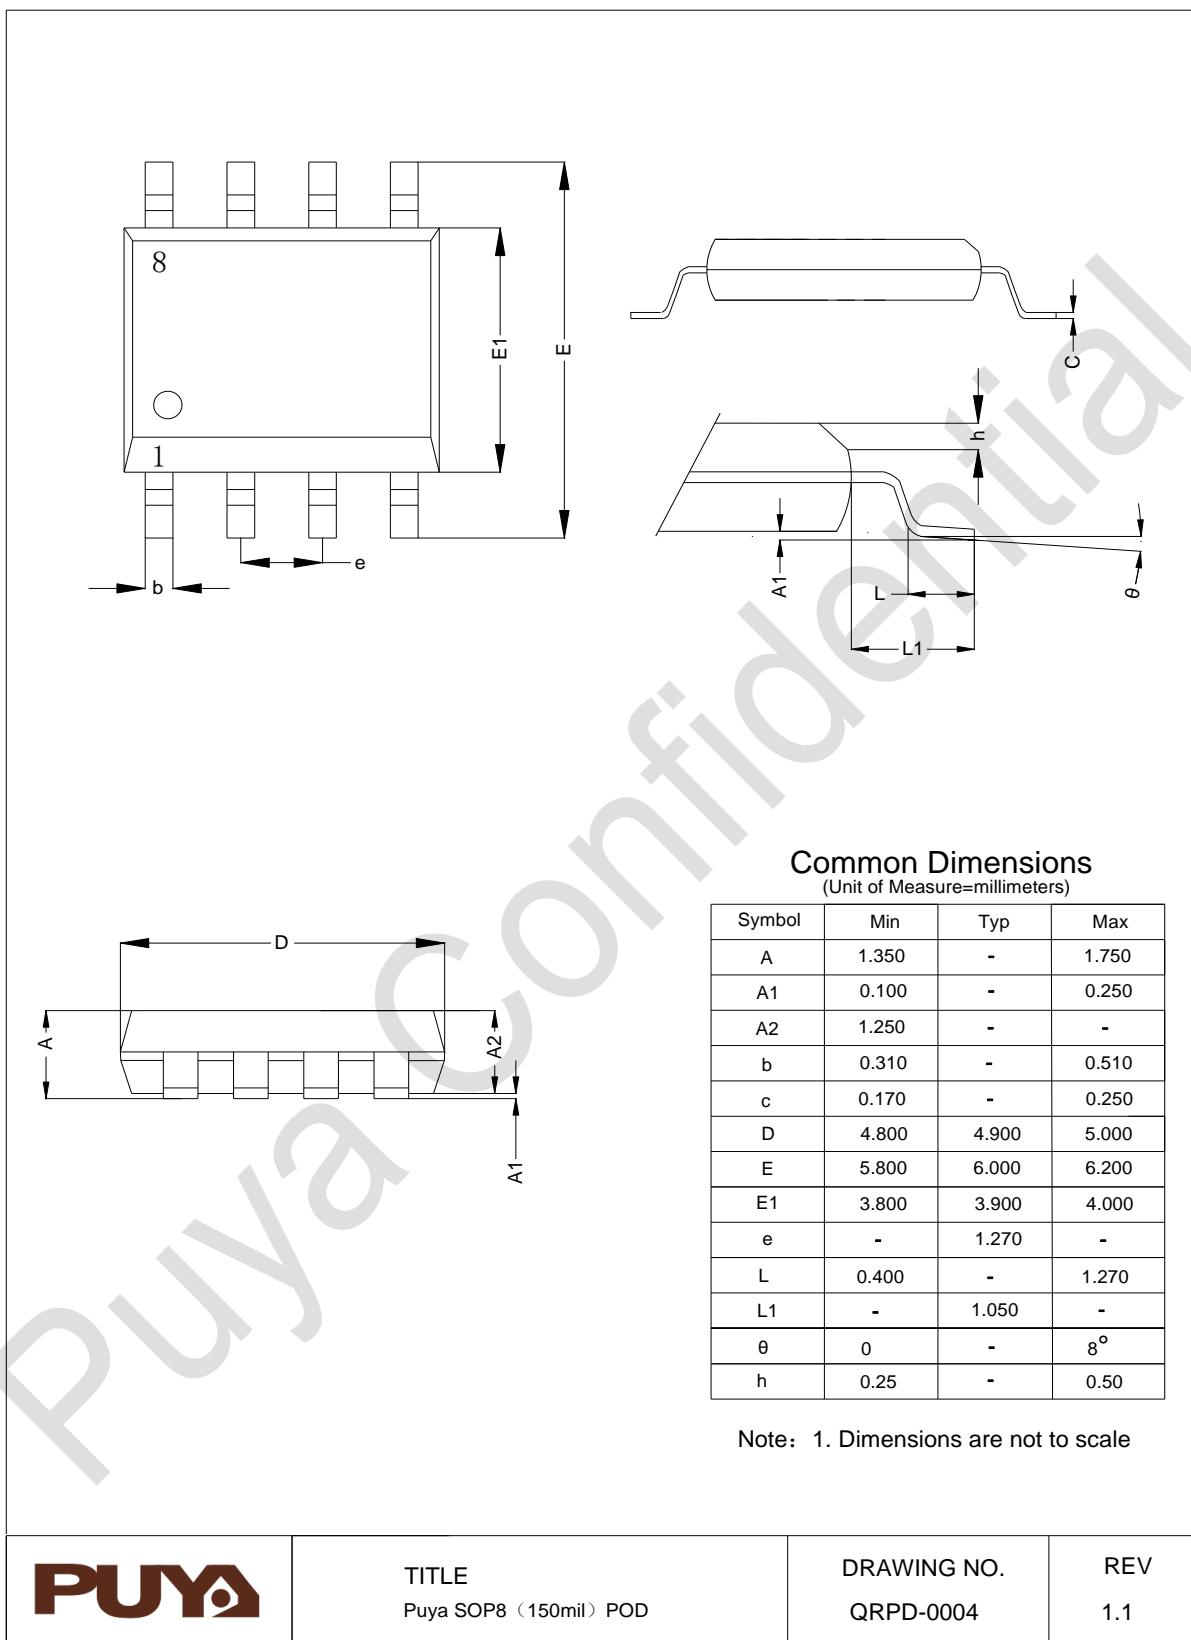

TITLE
Puya MSOP10 POD

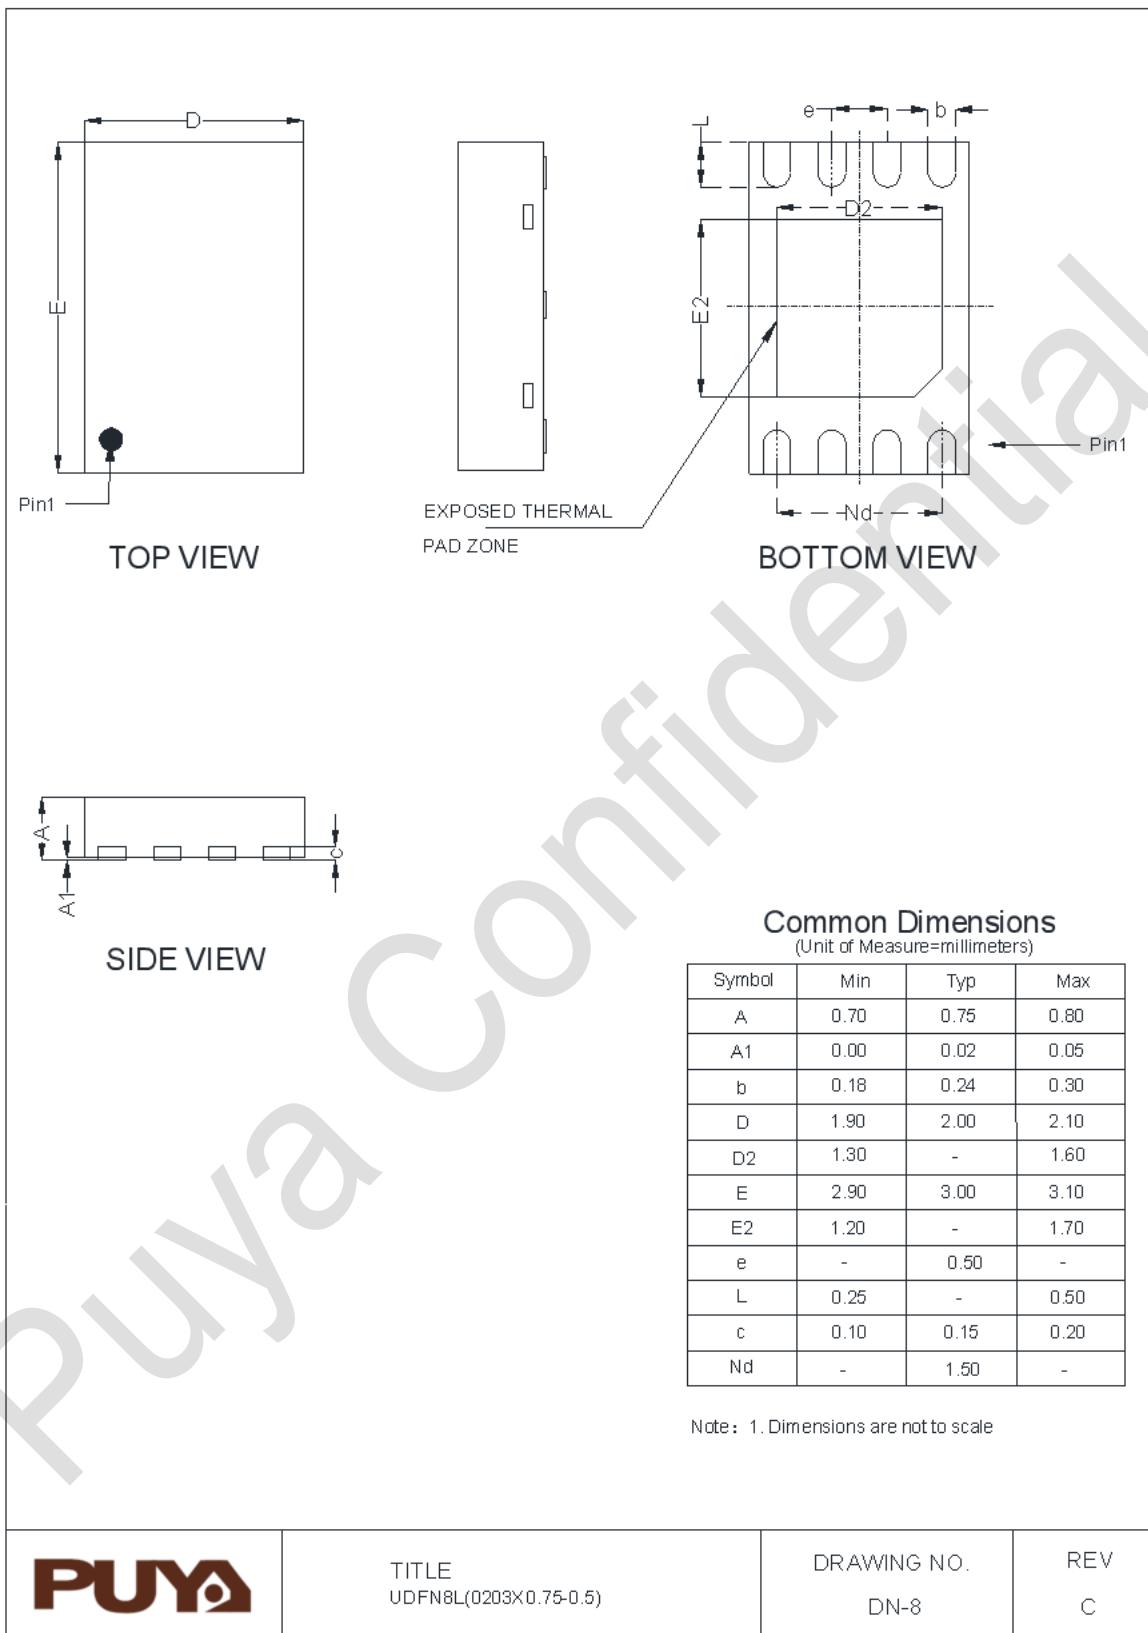

DRAWING NO.
QRPD-0049

REV
1.0

6.6. SOP8

6.7. DFN8(3*2)

7. Ordering Information

Example:	PY	32	F	003	F1	6	T	6	x	-	X
Company											
Product family											
ARM® based 32-bit microcontroller											
Product type											
F = General purpose											
Sub-family											
003 = PY32F003xx											
Pin count											
F1 = 20 pins Pinout1											
F2 = 20 pins Pinout2											
F3 = 20 pins Pinout3											
F4 = 20 pins Pinout4											
F5 = 20 pins Pinout5											
F6 = 20 pins Pinout6											
W1 = 16 pins Pinout1											
A1 = 10 pins Pinout1											
L1 = 8 pins Pinout1											
L2 = 8 pins Pinout2											
User code memory size											
8 = 64 Kbytes											
7 = 48 Kbytes											
6 = 32 Kbytes											
4 = 16 Kbytes											
Package											
U = QFN											
P = TSSOP											
S = SOP											
N = MSOP											
D = DFN											
Temperature range											
6 = -40°C to +85°C											
7 = -40°C to +105°C											
Options											
xxx = code ID of programmed parts (includes packing type)											
TR = tape and reel packing											
TU = Tube Packing											
blank = tray packing											
Delimiter character											
Version											
X = Version X											

8. Version history

Version	Date	Description
V1.0	2022-01-14	Initial version
V1.1	2022-01-18	1. Updated Table 2-1 2. Updated Table 6-15
V1.2	2022-01-24	1. Updated parameters in Table 6-30
V1.3	2023-01-24	1. Updated the format
V1.4	2024-02-06	1. Add SOP20/SOP16/MSOP10/DFN8(3*2) /SOP8 packages
V1.5	2024-02-23	1. Add PY32F003F16U6-E(QFN20 package)
V1.6	2024-03-13	1. Add PY32F003F16P6-E/PY32F003F18U7-E

Puya Semiconductor Co., Ltd.
