

PY25R256HB

Low Power, 256M-bit Serial Multi I/O Flash Memory Datasheet

Performance Highlight

- ◆ Supply Range from 2.7 to 3.6V for Read, Erase and Program
- ◆ Low Power consumption for Read, Erase and Program
- ♦ X1, X2 and X4 Multi I/O, QPI, DTR Support
- High reliability with 100K cycling and 20 Year-retention
- ◆ Permanently fixed QE bit, QE=1; and 4 I/O mode is enabled
- ◆ Provide Authentication feature by Monotonic Counter (MC) Feature

Puya Semiconductor Page 1 of 116

1 Overview

General

- Single 2.7 to 3.6V supply
- Industrial Temperature Range -40C to 85C
- Serial Peripheral Interface (SPI) Compatible: Mode 0 and Mode 3
- · Single, Dual, Quad SPI, QPI, DTR

Standard SPI: SCLK, CS#, SI, SODual SPI: SCLK, CS#, IO0, IO1

Quad SPI: SCLK, CS#, IO0, IO1, IO2, IO3
QPI: SCLK, CS#, IO0, IO1, IO2, IO3
DTR: Double Transfer Rate Read

Flexible Architecture for Code and Data Storage

Uniform 256-byte Page Program
 Uniform 4K-byte Sector Erase
 Uniform 32K/64K-byte Block Erase

- Full Chip Erase

One Time Programmable (OTP) Security Register

- 3*1024-Byte Security Registers with OTP Lock

• 128-bit Unique ID for each device

• Support Replay Protection Monotonic Counter (RPMC)

- Four 32-bit Monotonic Counters
- Volatile HMAC Key register
- Non-volatile Root Key register

Fast Program and Erase Speed Typical

- 0.25ms Page program time

30ms 4K-byte sector erase time0.10/0.15s 32K/64K-byte block erase time

- 64s Full chip erase time

JEDEC Standard Manufacturer and Device ID Read Methodology

Ultra-Low Power Consumption Typical

2uA Deep Power Down current

- 40uA Standby current

7mA Active Read current at 80MHz 4IO12mA Active Program or Erase current

High Reliability

- 100,000 Program / Erase Cycles
- 20-year Data Retention

Industry Standard Green Package Options

8-Pad WSON(6x5x0.75mm, 8x6x0.75mm)

- 16-Lead SOP(300mil)

Puya Semiconductor

2 Description

The PY25R256HB is a serial interface Flash memory device designed for use in a wide variety of high-volume consumer-based applications in which program code is shadowed from Flash memory into embedded or external RAM for execution. The flexible erase architecture of the device, with its page erase granularity it is ideal for data storage as well, eliminating the need for additional data storage devices.

The erase block sizes of the device have been optimized to meet the needs of today's code and data storage applications. By optimizing the size of the erase blocks, the memory space can be used much more efficiently. Because certain code modules and data storage segments must reside by themselves in their own erase regions, the wasted and unused memory space that occurs with large sectored and large block erase Flash memory devices can be greatly reduced. This increased memory space efficiency allows additional code routines and data storage segments to be added while still maintaining the same overall device density.

The device also contains an additional 3*1024-byte security registers with OTP lock (One-Time Programmable), can be used for purposes such as unique device serialization, system-level Electronic Serial Number (ESN) storage, locked key storage, etc.

Specifically designed for use in many different systems, the device supports read, program, and erase operations with a supply voltage range of 2.7V to 3.6V. No separate voltage is required for programming and erasing.

3 Pin Definition

3.1 Pin Configurations

8-Pad WSON (6x5/8x6mm)

3.2 Pin Descriptions

Table 3-2-1 Pin Descriptions for WSON8

No.	Symbol	Extension	Remarks
1	CS#	ı	Chip select
2	SO(IO1)	I/O	Serial data output for 1 x I/O Serial data input and output for 2 x I/O read mode Serial data input and output for 4 x I/O read mode
3	102	I/O	Serial data input and output for 4 x I/O read mode With weak pull up
4	GND	-	Ground of the device
5	SI(IO0)	1/0	Serial data input for 1x I/O Serial data input and output for 2 x I/O read mode Serial data input and output for 4 x I/O read mode
6	SCLK	1	Serial interface clock input
7	IO3	I/O	Serial data input and output for 4 x I/O read mode With weak pull up
8	VCC	-	Power supply of the device

Notes:

- 1. IO0 and IO1 are used for Standard and Dual SPI instructions.
- 2. IO0 IO3 are used for Quad SPI instructions.
- 3. For KGD, the RESET# pad which used for 16 pin package should be bonded to VCC.

7	CS#	I	Chip select
8	SO(IO1)	1/0	Serial data output for 1 x I/O Serial data input and output for 2 x I/O read mode Serial data input and output for 4 x I/O read mode
9	IO2	I/O	Serial data input and output for 4 x I/O read mode
10	GND	-	Ground of the device
11	NC		No Connect
12	NC	-	No Connect
13	NC	-	No Connect
14	NC	-	No Connect
15	SI(IO0)	I/O	Serial data input for 1x I/O Serial data input and output for 2 x I/O read mode Serial data input and output for 4 x I/O read mode
16	SCLK	I	Serial interface clock input

Notes

- 1. IO0 and IO1 are used for Standard and Dual SPI instructions
- 2. IO0 IO3 are used for Quad SPI instructions.
- 3. The RESET# pin on SOP-16 package is a dedicated hardware reset pin regardless of device settings. This pin can't be floating.

5 Electrical Specifications

5.1 Absolute Maximum Ratings

	Storage Temperature65°C to +150°C
•	Operation Temperature40°C to +85°C
•	Maximum Operation Voltage 4.1V
•	Voltage on Any Pin with
	respect to Ground0.6V to VCC+ 0.5V

DC Output Current5.0 mA

NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5-1 Pin Capacitance^[1]

Symbol	Parameter	Max	Units	Test Condition
Соит	Output Capacitance	8	pF	V _{OUT} =GND
C _{IN}	Input Capacitance	6	pF	V _{IN} =GND

Note:

1. Test Conditions: T_A= 25°C, F = 1MHz, Vcc = 3.0V.

5.4 AC Characteristics for Program and Erase

Table 5-4 AC parameters for program and erase (1) (Ta=-40°C ~ +85°C)

Cumbal	Parameter		Units		
Symbol	Parameter	Min	Typ ⁽²⁾	Max	Units
T _{ESL} ⁽⁵⁾	Erase Suspend Latency			30(6)	us
T _{PSL} ⁽⁵⁾	Program Suspend Latency			20	us
T _{PRS} ⁽³⁾	Latency between Program Resume and next Suspend	1			us
T _{ERS} ⁽⁴⁾	Latency between Erase Resume and next Suspend	1			us
t _{bP}	Byte program time		40	100	us
t _{PP}	Page program time (up to 256 bytes)		0.25	2.4	ms
t _{SE}	Sector erase time		30	240	ms
t _{BE1}	Block erase time for 32K bytes		0.10	0.8	S
t _{BE2}	Block erase time for 64K bytes		0.15	1.2	S
t _{CE}	Chip erase time		64	160	S

Note:

- 1. The value guaranteed by design or characterization, not 100% tested in production.
- 2. Typical value at 25°C, VCC=3.0V.
- 3. Program operation may be interrupted as often as system request. The minimum timing of tPRS must be observed before issuing the next program suspend command. However, in order for a Program operation to make progress, tPRS ≥ 100us must be included in resume-to-suspend loop(s). Not 100% tested.
- 4. Erase operation may be interrupted as often as system request. The minimum timing of tERS must be observed before issuing the next erase suspend command. However, in order for an Erase operation to make progress, tERS ≥ 100us must be included in resume-to-suspend loop(s). Notes. Not 100% tested.
- 5. Latency time is required to complete Erase/Program Suspend operation.
- 6. T_{ESL} should be waited, but cannot check by WIP.

Figure 5-4 Serial Input Timing

Figure 5-5 Output Timing

Puya Semiconductor Page 11 of 116

5.5 Operation Conditions

At Device Power-Up and Power-Down

AC timing illustrated in "Figure AC Timing at Device Power-Up" and "Figure Power-Down Sequence" are for the supply voltages and the control signals at device power-up and power-down. If the timing in the figures is ignored, the device will not operate correctly.

During power-up and power-down, CS# needs to follow the voltage applied on VCC to keep the device not to be selected. The CS# can be driven low when VCC reach Vcc(min.) and wait a period of tVSL.

Figure 5-8 AC Timing at Device Power-Up

Figure 5-9 Power-up Timing

Puya Semiconductor Page 12 of 116

Power Up/Down and Voltage Drop

For Power-down to Power-up operation, the VCC of flash device must below VPWD for at least tPWD timing. Please check the table below for more detail.

Figure 5-10 Power down-up Timing

Symbol	Parameter	Min	Max	Units
VPWD	VCC voltage needed to below VPWD for ensuring initialization will occur		1.5	V
tPWD	The minimum duration for ensuring initialization will occur	300		us
tVSL	VCC(min.) to device operation	2.5		ms
tVR	VCC Rise Time	1	500,000	us/V
VWI	Write Inhibit Voltage	1.7	2.1	V

Note: if power down in erase operation, there are over erase risk. So need erase the same region again after next power up.

Initial Delivery State

The device is delivered with the memory array erased: all bits are set to 1 (each byte contains FFH). The Status Register contains 00h (all Status Register bits are 0).

Puya Semiconductor Page 13 of 116

6 Data Protection

During power transition, there may be some false system level signals which result in inadvertent erasure or programming. The device is designed to protect itself from these accidental write cycles.

The state machine will be reset as standby mode automatically during power up. In addition, the control register architecture of the device constrains that the memory contents can only be changed after specific command sequences have completed successfully.

In the following, there are several features to protect the system from the accidental write cycles during VCC power-up and power-down or from system noise.

- Power-on reset: to avoid sudden power switch by system power supply transition, the power-on reset may protect the Flash.
- Valid command length checking: The command length will be checked whether it is at byte base and completed on byte boundary.
- Write Enable (WREN) command: WREN command is required to set the Write Enable Latch bit (WEL) before issuing other commands to change data.
- Software Protection Mode: The Block Protect (BP4, BP3, BP2, BP1, and BP0) bits define the section of the memory array that can be read but not change.
- Deep Power-Down Mode: By entering deep power down mode, the flash device is under protected from writing all commands except the Release from Deep Power-Down Mode command.

^{1.} X=don't care

^{2.} If any erase or program command specifies a memory that contains protected data portion, this command will be ignored.

Table 6-3. PY25R256HB Individual Block Protection (WPS=1)

Notes:

- 1. Individual Block/Sector protection is only valid when WPS=1.
- 2. All individual block/sector lock bits are set to 1 by default after power up, all memory array is protected.
- 3. Global Block Unlock instruction (98H) must previously have been executed before Chip Erase instruction when WPS=1.

Puya Semiconductor Page 16 of 116

7 Memory Address Mapping

The memory array can be erased in three levels of granularity including a full chip erase. The size of the erase blocks is optimized for both code and data storage applications, allowing both code and data segments to reside in their own erase regions.

Each device has	Each block has	Each sector has	Each page has	
32M	64/32K	4K	256	bytes
128K	256/128	16	-	pages

8 Device Operation

Before a command is issued, status register should be checked to ensure device is ready for the intended operation.

When incorrect command is inputted to this LSI, this LSI becomes standby mode and keeps the standby mode until next CS# falling edge. In standby mode, SO pin of this LSI should be High-Z. When correct command is inputted to this LSI, this LSI becomes active mode and keeps the active mode until next CS# rising edge.

Input data is latched on the rising edge of Serial Clock (SCLK) and data shifts out on the falling edge of SCLK. The difference of serial peripheral interface mode 0 and mode 3 is shown as Figure 8-1.

For the following instructions: RDID, RDSR, RDSR1, RDSCUR, READ, FREAD, DREAD, 2READ, 4READ, QREAD, RDSFDP, RES, REMS, DREMS, QREMS, the shifted-in instruction sequence is followed by a data-out sequence. After any bit of data being shifted out, the CS# can be high. For the following instructions: WREN, WRDI, WRSR, PE, SE, BE32K, BE, CE, PP, QPP, DP, ERSCUR, PRSCUR, SUSPEND, RESUME, RSTEN, RST, the CS# must go high exactly at the byte boundary; otherwise, the instruction will be rejected and not executed.

During the progress of Write Status Register, Program, Erase operation, to access the memory array is neglected and not affect the current operation of Write Status Register, Program, Erase.

Figure 8-1 Serial Peripheral Interface Modes Supported

Note: CPOL indicates clock polarity of serial master, CPOL=1 for SCLK high while idle, CPOL=0 for SCLK low while not transmitting. CPHA indicates clock phase. The combination of CPOL bit and CPHA bit decides which serial mode is supported.

Puya Semiconductor Page 18 of 116

Standard SPI

The PY25R256HB features a serial peripheral interface on 4 signals bus: Serial Clock (SCLK), Chip Select (CS#), Serial Data Input (SI) and Serial Data Output (SO). Both SPI bus mode 0 and 3 are supported. Input data is latched on the rising edge of SCLK and data shifts out on the falling edge of SCLK.

Dual SPI

The PY25R256HB supports Dual SPI operation when using the "Dual Output Fast Read" and "Dual I/O Fast Read" (3BHand BBH) commands. These commands allow data to be transferred to or from the device at two times the rate of the standard SPI. When using the Dual SPI command the SI and SO pins become bidirectional I/O pins: IO0 and IO1.

Quad SPI

The PY25R256HB supports Quad SPI operation when using the "Quad Output Fast Read", "Quad I/O Fast Read" (6BH, EBH) commands. These commands allow data to be transferred to or from the device at four times the rate of the standard SPI. When using the Quad SPI command, the SI and SO pins become bidirectional I/O pins: IO0 and IO1. For PY25R256HB, the QE bit is set to 1 as default and cannot be changed.-

QPI

The PY25R256HB supports Quad Peripheral Interface (QPI) operations only when the device is switched from Standard/Dual/Quad SPI mode to QPI mode using the "Enable the QPI (38H)" command. The QPI mode utilizes all four IO pins to input the command code. Standard/Dual/Quad SPI mode and QPI mode are exclusive. Only one mode can be active at any given times. "Enable the QPI (38H)" and "Disable the QPI (FFH)" commands are used to switch between these two modes. Upon power-up and after software reset using "Reset (99H)" command, the default state of the device is Standard/Dual/Quad SPI mode. For PY25R256HB, the QE bit is set to 1 as default and cannot be changed.

Puya Semiconductor Page 19 of 116

SPI / QPI DTR Read Instructions

To effectively improve the read operation throughput without increasing the serial clock frequency, PY25R256HB introduces multiple DTR (Double Transfer Rate) Read instructions that support Standard/Dual/Quad SPI and QPI modes. The byte-long instruction code is still latched into the device on the rising edge of the serial clock similar to all other SPI/QPI instructions. Once a DTR instruction code is accepted by the device, the address input and data output will be latched on both rising and falling edges of the serial clock.

3-Byte / 4-Byte Address Modes

The PY25R256HB provides two Address Modes that can be used to specify any byte of data in the memory array. The 3-Byte Address Mode is backward compatible to older generations of serial flash memory that only support up to 128M-bit data. To address the 256M-bit or more data in 3-Byte Address Mode, Extended Address Register must be used in addition to the 3-Byte addresses.

4-Byte Address Mode is designed to support Serial Flash Memory devices from 256M-bit to 32G-bit. The extended Address Register is not necessary when the 4-Byte Address Mode is enabled.

Upon power up, the PY25R256HB can operate in either 3-Byte Address Mode or 4-Byte Address Mode, depending on the Non-Volatile Status Register Bit ADP (S17) setting. If ADP=0, the device will operate in 3-Byte Address Mode; if ADP=1, the device will operate in 4-Byte Address Mode. The factory default value for ADP is 0.

To switch between the 3-Byte or 4-Byte Address Modes, "Enter 4-Byte Mode (B7h)" or "Exit 4-Byte Mode (E9h)" instructions must be used. The current address mode is indicated by the Status Register Bit ADS (S16).

PY25R256HB also supports a set of basic SPI instructions which requires dedicated 4-Byte address regardless the device Address Mode setting.

Software Reset & Hardware RESET# pin

The PY25R256HB can be reset to the initial power-on state by a software Reset sequence, either in SPI mode or QPI mode. This sequence must include two consecutive commands: Enable Reset (66h) & Reset (99h). If the command sequence is successfully accepted, the device will take approximately tReady to reset. No command will be accepted during the reset period. For the SOIC-16, PY25R256HB provides a dedicated hardware/RESET pin. Drive the /RESET pin low for a minimum period of 1uS(tRLRH) will interrupt any ongoing external/internal operations and reset the device to its initial power-on state. Hardware/RESET pin has higher priority than other SPI input signals (/CS, CLK, IOs).

Note:

- 1. Hardware/RESET pin is available on SOIC-16 package only.
- 2. While a faster RESET# pulse (as short as a few hundred nanoseconds) will often reset the device, a 1us minimum is recommended to ensure reliable operation.
- 3. There is an internal pull-up resistor for the dedicated RESET# pin. If the reset function is not needed, this pin can be left floating in the system.

9.1.3 DTR Commands listing

Table 9-5 Command set (DTR Instructions, 3-Byte Address Mode)

Commands	Abbr.	Code	ADR Bytes	DMY Cycles	Data Bytes	Function description
DTR Fast Read	DTRFRD	0Dh	3	6	1+	DTR n byte fast read out
DTR 2IO Read	2DTRD	BDh	3	6/8	1+	DTR n byte read out by 2IO
DTR 4IO Read	4DTRD	EDh	3	8/10	1+	DTR n byte read out by 4IO
DTR 4IO Read with 4-Byte Address	4DTRD4B	EEH	4	8/10	1+	DTR n byte read out by 4IO

Note: in SPI DTR mode, DC bit can be used to set dummy cycles in 2DTRD/4DTRD.

Table 9-6 Command set (DTR Instructions, 4-Byte Address Mode)

Commands	Abbr.	Code	ADR Bytes	DMY Cycles	Data Bytes	Function description
DTR Fast Read	DTRFRD	0Dh	4	6	1+	DTR n byte fast read out
DTR 2IO Read	2DTRD	BDh	4	6/8	1+	DTR n byte read out by 2IO
DTR 4IO Read	4DTRD	EDh	4	8/10	1+	DTR n byte read out by 4IO
DTR 4IO Read with 4-Byte Address	4DTRD4B	EEH	4	8	1+	DTR n byte read out by 4IO

Table 9-7 Command set (DTR QPI Instructions, 3-Byte Address Mode)

Commands	Abbr.	Code	ADR Bytes	DMY Cycles	Data Bytes	Function description
DTR Fast Read	DTRFRD	0Dh	3	8/10	1+	DTR n byte fast read out by 4IO
DTR 4IO Read	4DTRD	EDh	3	8/10	1+	DTR n byte fast read out by 4IO
DTR Burst Read with Wrap		0Eh	3	8/10	1+	DTR n bytes burst read with wrap by 4IO
DTR 4IO Read with 4-Byte Address	4DTRD4B	EEH	4	8/10	1+	DTR n byte read out by 4IO

Note: in QPI DTR mode, DC bit can be used to set dummy cycles to 10 cycles for all QPI DTR read command.

Table 9-8 Command set (DTR QPI Instructions, 4-Byte Address Mode)

Commands	Abbr.	Code	ADR Bytes	DMY Cycles	Data Bytes	Function description
DTR Fast Read	DTRFRD	0Dh	4	8/10	1+	DTR n byte fast read out
DTR 4IO Read	4DTRD	EDh	4	8/10	1+	DTR n byte fast read out
DTR Burst Read with Wrap		0Eh	4	8/10	1+	DTR n bytes burst read with wrap by 4IO
DTR 4IO Read with 4-Byte Address	4DTRD4B	EEH	4	8/10	1+	DTR n byte read out by 4IO

NOTE:

1. Dual Output data

IO0 = (D6, D4, D2, D0)

IO1 = (D7, D5, D3, D1)

2. Dual Input Address

IO0 = (A30, A28, A26, A24,) A22, A20, A18, A16, A14, A12, A10, A8 A6, A4, A2, A0, M6, M4, M2, M0 IO1 = (A31, A29, A27, A25,) A23, A21, A19, A17, A15, A13, A11, A9 A7, A5, A3, A1, M7, M5, M3, M1

3. Quad Output Data

IO1 = (D5, D1, ...)

IO2 = (D6, D2, ...)

IO3 = (D7, D3, ...)

4. Quad Input Address

Puya Semiconductor Page 26 of 116

IO0 = (A28, A24,) A20, A16, A12, A8, A4, A0, M4, M0

IO1 = (A29, A25,) A21, A17, A13, A9, A5, A1, M5, M1

IO2 = (A30, A26,) A22, A18, A14, A10, A6, A2, M6, M2

IO3 = (A31, A27,) A23, A19, A15, A11, A7, A3, M7, M3

5. Fast Read Quad I/O Data

IO0 = (x, x, x, x, D4, D0, ...)

IO1 = (x, x, x, x, D5, D1, ...)

IO2 = (x, x, x, x, D6, D2, ...)

IO3 = (x, x, x, x, D7, D3, ...)

6. QPI Command, Address, Data input/output format:

CLK #0 1 2 3 4 5 6 7 8 9 10 11

IO0= C4, C0, (A28, A24,) A20, A16, A12, A8, A4, A0, D4, D0, D4, D0,

IO1= C5, C1, (A29, A25,) A21, A17, A13, A9, A5, A1, D5, D1, D5, D1

IO2= C6, C2, (A30, A26,) A22, A18, A14, A10, A6, A2, D6, D2, D6, D2

IO3= C7, C3, (A31, A27,) A23, A19, A15, A11, A7, A3, D7, D3, D7, D3

7. Security Registers Address:

Security Register1: (A31-A24=00H), A23-A16=00H, A15-A10=000100, A9-A0= Byte Address; Security Register2: (A31-A24=00H), A23-A16=00H, A15-A10=001000, A9-A0= Byte Address; Security Register3: (A31-A24=00H), A23-A16=00H, A15-A10=001100, A9-A0= Byte Address;

Table 9-9 Command set (RPMC OP1 Instructions)

RPMC Operation	Command (Byte0)	Cmd Type (Byte1)	Addr Bytes (Byte2)	Reserved (Byte3)	Data Bytes	Signature Bytes	
Write Root Key Register	9BH	00Н	Counter Addr[7:0]	00Н	Byte4-35 RootKey[255:0]	Byte36-63 TruncatedSign[223:0]	
Update HMAC Key Register	9BH	01H	Counter Addr[7:0]	00H	Byte4-7 KeyData[31:0]	Byte8-39 Signature[255:0]	
Increase Monotonic Counter	9BH	02H	Counter Addr[7:0]	00Н	Byte4-7 CounterData[31:0]	Byte8-39 Signature[255:0]	
Request Monotonic Counter	9BH	03H	Counter Addr[7:0]	00Н	Byte4-15 Tag[95:0]	Byte16-47 Signature[255:0]	
Reserved Commands	9BH	04H ~ FFH	Reserved				

Table 9-10 Command set (RPMC OP2 Instructions)

RPMC Operation	Command (Byte0)	Dummy (Byte1)	Data Output				
Read RPMC Status / Data	96H	dummy	Byte2 Status[7:0]	Byte3-14 Tag[95:0]	Byte15-18 CounterData[31:0]	Byte19-50 Signature[255:0]	

Note:

- 1. All RPMC instructions are in Standard SPI format. Each Input/Output Byte requires 8 clocks.
- 2. The Reserved (Byte3) for RPMC OP1 must be all 0s (00000000'b).
- 3. The controller may terminate the Read RPMC Status/Data instruction at any time without going through the entire data output sequence.
- 4. When BUSY=1, the device will output the RPMC_Status[7:0] value continuously until /CS terminates the instruction. The device will not output Tag[95:0], CounterData[31:0] & Signature[255:0] fields when BUSY=1. Once BUSY becomes 0, another OP2 command must be issued to read out the correct Tag[95:0], CounterData[31:0] & Signature[255:0] fields.

Puya Semiconductor Page 27 of 116

9.2 Write Enable (WREN 06H)

The Write Enable (WREN) instruction is for setting Write Enable Latch (WEL) bit. For those instructions like PP/PP4B, QPP/QPP4B, QIPP/QIPP4B, SE/SE4B, BE32K/BE32K4B, BE/BE4B, CE, and WRSR, WRCR, ERSCUR, PRSCUR, WREAR which are intended to change the device content, should be set every time after the WREN instruction setting the WEL bit.

The sequence of issuing WREN instruction is: CS# goes low→ sending WREN instruction code→ CS# goes high.

Figure 9-2 Write Enable (WREN) Sequence (Command 06)

Figure 9-2a Write Enable (WREN) Sequence (QPI)

Puya Semiconductor Page 28 of 116

9.3 Write Disable (WRDI 04H)

The Write Disable (WRDI) instruction is for resetting Write Enable Latch (WEL) bit.

The sequence of issuing WRDI instruction is: CS# goes low→ sending WRDI instruction code→ CS# goes high.

The WEL bit is reset by following situations:

- Power-up
- Write Disable (WRDI) instruction completion
- Write Status Register (WRSR/WRCR) instruction completion
- Page Program (PP/PP4B) instruction completion
- Quad Page Program (QPP/QPP4B) instruction completion
- Quad-In Page Program (QIPP/QIPP4B) instruction completion
- Sector Erase (SE/SE4B) instruction completion
- Block Erase (BE32K/BE32K4B, BE/BE4B) instruction completion
- Chip Erase (CE) instruction completion
- SBLK/SBULK/GBLK/GBULK instruction completion
- Erase Security Register (ERSCUR) instruction completion
- Program Security Register (PRSCUR) instruction completion
- Reset (RST) instruction completion

Figure 9-3 Write Disable (WRDI) Sequence (Command 04)

Figure 9-3a Write Disable (WRDI) Sequence (QPI)

Puya Semiconductor Page 29 of 116

9.4 Write Enable for Volatile Status Register (VWREN 50H)

The non-volatile Status Register bits can also be written to as volatile bits. This gives more flexibility to change the system configuration and memory protection schemes quickly without waiting for the typical non-volatile bit write cycles or affecting the endurance of the Status Register non-volatile bits. The Write Enable for Volatile Status Register command must be issued prior to a Write Status Register command. The Write Enable for Volatile Status Register command will not set the Write Enable Latch bit, it is only valid for the Write Status Register command to change the volatile Status Register bit values.

The sequence of issuing Write Enable for Volatile Status Register instruction is: CS# goes low→ sending Write Enable for Volatile Status Register instruction code→ CS# goes high.

Figure 9-4 Write Enable for Volatile Status Register Sequence (Command 50)

Figure 9-4a Write Enable for Volatile Status Register Sequence (QPI)

Puya Semiconductor Page 30 of 116

9.5 Read Status Register (RDSR 05H/35H)

The RDSR instruction is for reading Status Register Bits. The Read Status Register can be read at any time (even in program/erase/write status register condition). It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress. For command code "05H", the SO will output Status Register bits S7~S0. The command code "35H", the SO will output Status Register bits S15~S8.

The sequence of issuing RDSR instruction is: CS# goes low→ sending RDSR instruction code→ Status Register data out on SO. The SIO[3:1] are "don't care".

Figure 9-5 Read Status Register (RDSR) Sequence (Command 05 or 35)

Figure 9-5a Read Status Register (RDSR) Sequence (QPI)

Status Register

BIT	S15	S14	S13	S12	S11	S10	S9	S8
Definition	SUS	CMP	LB3	LB2	LB1	EP_FAIL	QE	SRP1
Volatile	RO	N	OTP	OTP	OTP	RO	RO	N
Default	0	0	0	0	0	0	1	0

BIT	S7	S6	S5	S4	S3	S2	S1	S0
Definition	SRP0	BP4	BP3	BP2	BP1	BP0	WEL	WIP
Volatile	N	N	N	N	N	N	V	RO
Default	0	0	0	0	0	0	0	0

Note:

1. RO=read only, N=non-volatile, V= volatile, OTP=one time program

The definition of the status register bits is as below:

Puya Semiconductor Page 31 of 116

WIP bit.

The Write in Progress (WIP) bit indicates whether the memory is busy in program/erase/write status register progress. When WIP bit sets to 1, means the device is busy in program/erase/write status register progress, when WIP bit sets 0, means the device is not in program/erase/write status register progress.

WEL bit.

The Write Enable Latch (WEL) bit indicates the status of the internal Write Enable Latch. When set to 1 the internal Write Enable Latch is set, when set to 0 the internal Write Enable Latch is reset and no Write Status Register, Program or Erase command is accepted.

BP4, BP3, BP2, BP1, BP0 bits.

The Block Protect (BP4, BP3, BP2, BP1, and BP0) bits are non-volatile. They define the size of the area to be software protected against Program and Erase commands. These bits are written with the Write Status Register (WRSR) command. When the Block Protect (BP4, BP3, BP2, BP1, BP0) bits are set to 1, the relevant memory area (as defined in Table "Protected Area Sizes"). Becomes protected against Page Program (PP), Page Erase (PE), Sector Erase (SE) and Block Erase (BE) commands. The Block Protect (BP4, BP3, BP2, BP1, and BP0) bits can be written provided that the Hardware Protected mode has not been set. The Chip Erase (CE) command is executed, only if the Block Protect (BP4, BP3, BP2, BP1and BP0) are set to "None protected".

SRP1, SRP0 bits.

The Status Register Protect (SRP1 and SRP0) bits are non-volatile Read/Write bits in the status register. The SRP bits control the method of write protection: software protection, hardware protection, power supply lock-down or one time programmable protection

SRP1	SRP0	Status Register	Description
0	0	Software Protected	The Status Register and Configure Register can be written to after a Write Enable command
1	0	Power Supply Lock-Down (1)	Status Register and Configure Register are protected and cannot be written to again until the next Power-Down, Power-Up cycle.
1	1		Status Register and Configure Register are permanently protected and cannot be written to.

NOTE:

- 1. When SRP1, SRP0=(1, 0), a Power-Down, Power-Up cycle will change SRP1, SRP0 to (0, 0) state.
- 2. This feature is available on special order. Please contact PUYA for details.

QE bit.

The Quad Enable (QE) bit is a non-volatile Read/Write bit in the Status Register that allows Quad operation. The default value of QE bit is 1 and it cannot be changed, so that the IO2 and IO3 pins are enabled all the time

EP_FAIL bit.

The Erase/Program Fail bit is a read only bit which shows the status of the last Program/Erase (PP, QPP, QIPP, SE, BE32K, BE, CE and ERSCUR, PRSCUR) operation. The bit will be set to "1" if the program/erase operation failed or interrupted by reset or the program/erase region was protected. It will be automatically cleared to "0" if the next program/erase operation succeeds. Please note that it will not interrupt or stop any operation in the flash memory.

LB3, LB2, LB1, bits.

The LB3, LB2, LB1, bits are non-volatile One Time Program (OTP) bits in Status Register (S13-S11) that provide the write protect control and status to the Security Registers. The default state of LB3-LB1are0, the security registers are unlocked. The LB3-LB1bitscan be set to 1 individually using the Write Register instruction. The LB3-LB1bits are One Time Programmable, once its set to 1, the Security Registers will

Puya Semiconductor Page 32 of 116

become read-only permanently.

CMP bit

The CMP bit is a non-volatile Read/Write bit in the Status Register(S14). It is used in conjunction the BP4-BP0 bits to provide more flexibility for the array protection. Please see the table "Protected Area Size" for details. The default setting is CMP=0.

SUS bit

The SUS bit is read only bit in the status register (S15) that is set to 1 after executing a Suspend (75H) command in Program/Erase progress. The SUS bit is cleared to 0 by Program/Erase Resume (7AH) command and a power-down power-up cycle, soft reset, hard reset.

Puya Semiconductor Page 33 of 116

9.6 Read Configure Register (RDCR 15H)

The RDCR instruction is for reading Configure Register Bits. The Read Configure Register can be read at any time (even in program/erase/write status register condition). It is recommended to check the Write in Progress (WIP) bit before sending a new instruction when a program, erase, or write status register operation is in progress.

The sequence of issuing RDCR instruction is: CS# goes low→ sending RDCR instruction code→ Configure Register data out on SO. The SIO[3:1] are "don't care" in SPI mode.

Figure 9-6 Read Status Register (RDCR) Sequence (Command 15)

Figure 9-6a Read Status Register (RDCR) Sequence (QPI)

Configure Register

BIT	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Definition	Reserved	DRV1	DRV0	DLP	DC	WPS	ADP	ADS
Type	N	N	N	V	V	N	N	RO
Default	0	0	0	0	0	0	0	0

Note: RO=read only, N=non-volatile, V= volatile

DRV1 & DRV0 bit.

The DRV1 & DRV0 bits are non-volatile Read/Write bits which are used to determine the output driver strength for the Read operations.

DRV1, DRV0	Drive Strength		
0,0(default)	100%(default)		
0,1	67%		
1,0	133%		
1,1	167%		

Puya Semiconductor Page 34 of 116

DLP bit.

The DLP bit is Data Learning Pattern Enable bit, which is volatile writable by 11H command. For DTR Read commands, a pre-defined "Data Learning Pattern" can be used by the flash memory controller to determine the flash data output timing on I/O pins. When DLP=1, in dummy cycles, the flash will output "00110100" Data Learning Pattern sequence on each of the I/O pins. During this period, controller can fine tune the data latching timing for each I/O pins to achieve optimum system performance. DLP=0(default) will disable the Data Learning Pattern output.

DC bit

The Dummy Cycle (DC) bit is a volatile bit. The Dummy Cycle (DC) bit can be used to configure the number of dummy clocks for "SPI 2 X IO Read (BBH/BCH)" command, "SPI 4X I/O Read (EBH/ECH)" command, "DTR 2IO read(BDH)", "DTR 4IO read(EDH/EEH)", and "DTR Burst Read with Wrap(0EH)".

Dummy Cycle Table

Mode	Command	DC bit	Number of dummy cycles	
	BBH/BCH	0(default)	4	
	вып/всп	1	8	
	EBH/ECH	0(default)	6	
ODI		1	10	
SPI mode	BDH	0(default)	6	
	חטם	1	8	
	EDII/EEII	0(default)	8	
	EDH/EEH	1	10	
QPI mode	0DH/EDH/	0(default)	8	
QFIMode	EEH/0EH	1	10	

WPS bit.

The WPS bit is a non-volatile Read/Write bit which is used to select which Write Protect scheme should be used. When WPS=0(default), the device will use the combination of CMP, BP[4:0] bits to protect a specific area of the memory array. When WPS=1, the device will utilize the Individual Block Locks to protect any individual sector or blocks. The default value for all Individual Block Lock bits is 1 upon device power on or after reset.

ADP bit.

The ADP bit is a non-volatile Read/Write bit that determines the initial address mode when the device is powered on or reset. This bit is only used during the power on or device reset initialization period, and it is only writable by the non-volatile Write Status sequence (06h + 11h). When ADP=0 (factory default), the device will power up into 3-Byte Address Mode, the Extended Address Register must be used to access memory regions beyond 128Mb. When ADP=1, the device will power up into 4-Byte Address Mode directly.

ADS bit.

The Current Address Mode bit is a read only bit that indicates which address mode the device is currently operating in. When ADS=0, the device is in the 3-Byte Address Mode, when ADS=1, the device is in the 4-Byte Address Mode.

Puya Semiconductor Page 35 of 116

9.7 Write Status Register (WRSR 01H/31H)

The Write Status Register (WRSR) command allows new values to be written to the Status Register. Before it can be accepted, a Write Enable (WREN) command must previously have been executed. After the Write Enable (WREN) command has been decoded and executed, the device sets the Write Enable Latch (WEL).

The Write Status Register (WRSR) command has no effect on S15, S10, S1 and S0 of the Status Register. CS# must be driven high after the eighth or sixteen bit of the data byte has been latched in. If not, the Write Status Register (WRSR) command is not executed. If CS# is driven high after eighth bit of the data byte, the S15~S8 Bits will keep the previously value. As soon as CS# is driven high, the self-timed Write Status Register cycle (whose duration is tW) is initiated. While the Write Status Register cycle is in progress, the Status Register may still be read to check the value of the Write In Progress (WIP) bit. The Write In Progress (WIP) bit is 1 during the self-timed Write Status Register cycle, and is 0 when it is completed. When the cycle is completed, the Write Enable Latch (WEL) is reset.

The Write Status Register (WRSR) command allows the user to change the values of the Block Protect (BP4, BP3, BP1, and BP0) bits, to define the size of the area that is to be treated as read-only, as defined in Table1.

The sequence of issuing WRSR instruction is: CS# goes low→ sending WRSR instruction code→ Status Register data on SI→CS# goes high.

The CS# must go high exactly at the 8 bits data boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Status Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset.

Figure 9-7 Write Status Register (WRSR) Sequence (Command 01 or 31)

Figure 9-7a Write Status Register (WRSR) Sequence (QPI)

Puya Semiconductor Page 36 of 116

To be backward compatible to Puya's previous serial flash product, The Write Status Register (WRSR) command also support to write Status Register-0 and Status Register-1 in same time. To complete this function, CS# must be driven high after the sixteenth bit of the data byte has been latched in. If CS# is driven high after the eighth clock, the Write Status Register (01h) command will only program the Status Register-0, the Status Register-1 will not be affected (Previous product will clear CMP and QE bits).

Figure 9-7b Write Status Register (WRSR) with 2 Byte data Sequence (SPI)

Figure 9-7c Write Status Register (WRSR) with 2 Byte data Sequence (QPI)

Puya Semiconductor Page 37 of 116

9.8 Write Configure Register (WRCR 11H)

The Write Configure Register (WRCR) command allows new values to be written to the Configure Register. Before it can be accepted, a Write Enable (WREN) command must previously have been executed. After the Write Enable (WREN) command has been decoded and executed, the device sets the Write Enable Latch (WEL).

The sequence of issuing WRCR instruction is: CS# goes low→ sending WRCR instruction code→ Configure Register data on SI→CS# goes high.

The CS# must go high exactly at the 8 bits data boundary; otherwise, the instruction will be rejected and not executed. The self-timed Write Status Register cycle time (tW) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Write Status Register cycle is in progress. The WIP sets 1 during the tW timing, and sets 0 when Write Configure Register Cycle is completed, and the Write Enable Latch (WEL) bit is reset.

Figure 9-8 Write Configure Register (WRCR) Sequence (Command 11)

Figure 9-8a Write Configure Register (WRCR) Sequence (QPI)

Puya Semiconductor Page 38 of 116

9.9 Read Extended Address Register (RDEAR C8H)

When the device is in the 3-Byte Address Mode, the Extended Address Register is used as the 4th address byte A[31:24] to access memory regions beyond 128Mb.

The Read Extended Address Register instruction is entered by driving CS# low and shifting the instruction code "C8h" into the SI pin on the rising edge of SCLK. The Extended Address Register bits are then shifted out on the SO pin at the falling edge of SCLK with most significant bit (MSB) first.

When the device is in the 4-Byte Address Mode, the Extended Address Register is not used.

Figure 9-9 Read Extended Address Register Sequence (Command C8)

Figure 9-9a Read Extended Address Register Sequence (QPI)

Extend Address Register

EA	EA7	EA6	EA5	EA4	EA3	EA2	EA1	EA0
Definition	Reserved	A24						
Type	-	-	-	-	-	-	-	Volatile
Default	0	0	0	0	0	0	0	0

A24 bit.

The Extended Address Bit A24 is used only when the device is operating in the 3-Byte Address Mode (ADS=0), which is volatile writable by C5H command. The lower 128Mb memory array (00000000h – 00FFFFFFh) is selected when A24=0(default), and all instructions with 3-Byte addresses will be executed within that region. When A24=1, the upper 128Mb memory array (01000000h – 01FFFFFFh) will be selected.

If the device is in 4-Byte Address mode, the device will require 4-Byte address input for all address related instructions, and the Extended Address Bit A24 setting will be ignored. However, any instruction with 4-Byte address input will replace the Extended Address Bit A24 with new settings.

Puya Semiconductor Page 39 of 116

9.10 Write Extended Address Register (WREAR C5H)

The Extended Address Register is a volatile register that stores 4th byte address (A31-A24) When the device is operating in the 3-Byte Address Mode (ADS=0). To write the Extended Address Register bits, a Write Enable (06h) instruction must previously have been executed for the device to accept the Write Extended Address Register instruction (Status Register bit WEL must equal 1). Once write enabled, the instruction is entered by driving CS# low, sending the instruction code "C5h", and then writing the Extended Address Register data byte.

Upon power up or the execution of a Software/Hardware Reset, the Extended Address Register bit values will be cleared to 0.

The Extended Address Register is only effective when the device is in the 3-Byte Address Mode. When the device operates in the 4-Byte Address Mode (ADS=1), any command with address input of A31-A24 will replace the Extended Address Register values. It is recommended to check and update the Extended Address Register if necessary when the device is switched from 4-Byte to 3-Byte Address Mode.

Figure 9-10 Write Extended Address Register Sequence (Command C5)

Figure 9-10a Write Extended Address Register Sequence (QPI)

Puya Semiconductor Page 40 of 116

9.11 Enter 4-Byte Address Mode (B7H)

The Enter 4-Byte Address Mode instruction will allow 32-bit address (A31-A0) to be used to access the memory array beyond 128Mb. The Enter 4-Byte Address Mode instruction is entered by driving CS# low, shifting the instruction code "B7h" into the SI pin and then driving CS# high.

Figure 9-11 Enter 4-Byte Address Mode Sequence (Command B7)

Figure 9-11a Enter 4-Byte Address Mode Sequence (QPI)

Puya Semiconductor Page 41 of 116

9.12 Exit 4-Byte Address Mode (E9H)

In order to be backward compatible, the Exit 4-Byte Address Mode instruction will only allow 24-bit address (A23-A0) to be used to access the memory array up to 128Mb. The Extended Address Register must be used to access the memory array beyond 128Mb. The Exit 4-Byte Address Mode instruction is entered by driving CS# low, shifting the instruction code "E9h" into the SI pin and then driving CS# high.

Figure 9-12 Exit 4-Byte Address Mode Sequence (Command E9)

Figure 9-12a Exit 4-Byte Address Mode Sequence (QPI)

Puya Semiconductor Page 42 of 116

9.13 Read Data Bytes (READ 03H)

The Read Data instruction allows one or more data bytes to be sequentially read from the memory. The instruction is initiated by driving the CS# pin low and then shifting the instruction code "03h" followed by a 32/24-bit address (A31/A23-A0) into the SI pin. The code and address bits are latched on the rising edge of the SCLK pin. After the address is received, the data byte of the addressed memory location will be shifted out on the SO pin at the falling edge of SCLK with most significant bit (MSB) first. The address is automatically incremented to the next higher address after each byte of data is shifted out allowing for a continuous stream of data. This means that the entire memory can be accessed with a single instruction as long as the clock continues. The instruction is completed by driving CS# high.

If a Read Data instruction is issued while an Erase, Program or Write cycle is in process (BUSY=1) the instruction is ignored and will not have any effects on the current cycle.

Figure 9-13 Read Data Bytes (READ) Sequence (Command 03)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 43 of 116

9.14 Read Data Bytes with 4-Byte Address (READ4B 13H)

The Read Data with 4-Byte Address instruction is similar to the Read Data (03h) instruction. Instead of 24- bit address, 32-bit address is needed following the instruction code 13h. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Read Data with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

If this instruction is issued while an Erase, Program or Write cycle is in process (BUSY=1) the instruction is ignored and will not have any effects on the current cycle.

Figure 9-14 Read Data Bytes with 4-Byte Address Sequence (Command 13)

Puya Semiconductor Page 44 of 116

9.15 Fast Read (FREAD 0BH)

The FASTREAD instruction is similar to the Read Data instruction except that it can quickly reading data out. The 24/32-bit address is latched on rising edge of SCLK, and data of each bit shifts out on the falling edge of SCLK at a maximum frequency fC. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single FREAD instruction. The address counter rolls over to 0 when the highest address has been reached.

While Program/Erase/Write Status Register cycle is in progress, FREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 9-15 Fast Read (FREAD) Sequence (Command 0B)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Fast Read in QPI mode

The Fast Read command is also supported in QPI mode. In QPI mode, the number of dummy clocks is configured by the "Set Read Parameters (C0H)" command to accommodate a wide range application with different needs for either maximum Fast Read frequency or minimum data access latency. Depending on the Read Parameter Bits P[5:4] setting, the number of dummy clocks can be configured as either 4/6/8/10.

Figure 9-15a Fast Read Sequence (QPI)

Note:

- 1. 32-bit address is required when the device is operation in 4-byte address mode.
- 2. C0H command can set the number of dummy clocks.

Puya Semiconductor

9.16 DTR Fast Read (DTR_FREAD 0DH)

The DTR Fast Read instruction is similar to the Fast Read instruction except that the 24/32-bit address input and the data output require DTR (Double Transfer Rate) operation. This is accomplished by adding six "dummy" clocks after the 24/32-bit address. The dummy clocks allow the devices internal circuits additional time for setting up the initial address. During the dummy clocks the data value on the DO pin is a "don't care".

Figure 9-16 DTR Fast Read Sequence (Command 0D)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

DTR Fast Read in QPI Mode

The DTR Fast Read instruction is also supported in QPI mode.

Figure 9-16a DTR Fast Read Sequence (QPI)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

When DC bit set to 1; 0DH in QPI with 10 Dummy Clocks.

Puya Semiconductor Page 46 of 116

9.17 Fast Read with 4-Byte Address (FREAD 0CH)

The Fast Read with 4-Byte Address instruction is similar to the Fast Read instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Read Data with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

The Fast Read with 4-Byte Address (0Ch) instruction is only supported in Standard SPI mode. In QPI mode, the instruction code 0Ch is used for the "Burst Read with Wrap" instruction.

Figure 9-17 Fast Read with 4-Byte Address Sequence (Command 0C)

Puya Semiconductor Page 47 of 116

9.18 Dual Read (DREAD 3BH)

The DREAD instruction enable double throughput of Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fT. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single DREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing DREAD instruction, the following data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing DREAD instruction is: CS# goes low \rightarrow sending DREAD instruction \rightarrow 3/4-byte address on SI \rightarrow 8-bit dummy cycle \rightarrow data out interleave on SIO1 & SIO0 \rightarrow to end DREAD operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, DREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 9-18 Dual Read Mode Sequence (Command 3B)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 48 of 116

9.19 Dual Read with 4-Byte Address (DREAD4B 3CH)

The Dual Read with 4-Byte Address instruction is similar to the Dual Read instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Dual Read with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

The Dual Read with 4-Byte Address (3Ch) instruction is only supported in Standard SPI mode.

Figure 9-19 Dual Read with 4-Byte Address Mode Sequence (Command 3C)

Puya Semiconductor Page 49 of 116

9.20 2IO Read (2READ BBH)

The 2READ instruction enables Double Transfer Rate of Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every two bits (interleave on 2 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fT. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 2READ instruction. The address counter rolls over to 0 when the highest address has been reached.

Once writing 2READ instruction, the following address/dummy/data out will perform as 2-bit instead of previous 1-bit.

The sequence of issuing 2READ instruction is: CS# goes low→ sending 2READ instruction→ 24/32-bit address interleave on SIO1 & SIO0→ 8-bit dummy cycle on SIO1 & SIO0→ data out interleave on SIO1 & SIO0→ to end 2READ operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, 2READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 9-20 2IO Read Sequence (Command BBH M5-4 ≠ (1,0))

Note:

- 1. 32-bit address is required when the device is operation in 4-byte address mode.
- 2. M[5-4] = (1,0) is inhibited.
- 3. DC bit can set the number of dummy clocks.

Puya Semiconductor Page 50 of 116

9.21 DTR 2IO Read (DTR_2READ BDH)

The DTR 2IO Read (BDh) instruction allows for improved random access while maintaining two IO pins, IO0 and IO1. It is similar to the DREAD (3Bh) instruction but with the capability to input the Address bits (A23/A31-0) two bits per clock. This reduced instruction overhead may allow for code execution (XIP) directly from the Dual SPI in some applications.

Figure 9-21 DTR 2IO Read Sequence (Command BDH M5-4 ≠ (1,0))

Note:

- 1. 32-bit address is required when the device is operation in 4-byte address mode.
- 2. DC bit can set the number of dummy clocks.

Puya Semiconductor Page 51 of 116

9.22 2IO Read with 4-Byte Address (2READ4B BCH)

The 2IO Read with 4-Byte Address instruction is similar to the 2IO Read instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the 2IORead with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

Figure 9-22 2IO Read with 4-Byte Address Sequence (Command BCH M5-4 ≠ (1,0))

Puya Semiconductor Page 52 of 116

9.23 Quad Read (QREAD 6BH)

The QREAD instruction enable quad throughput of Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single QREAD instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing QREAD instruction, the following data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing QREAD instruction is: CS# goes low \rightarrow sending QREAD instruction \rightarrow 3/4-byte address on SI \rightarrow 8-bit dummy cycle \rightarrow data out interleave on SIO3, SIO2, SIO1 & SIO0 \rightarrow to end QREAD operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, QREAD instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 9-23 Quad Read Sequence (Command 6BH)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 53 of 116

9.24 Quad Read with 4-Byte Address (QREAD4B 6CH)

The Quad Read with 4-Byte Address instruction is similar to the Quad Read instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Quad Read with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

The Quad Read with 4-Byte Address (6Ch) instruction is only supported in Standard SPI mode.

Figure 9-24 Quad Read with 4-Byte Address Sequence (Command 6CH)

Puya Semiconductor Page 54 of 116

9.25 4IO Read (4READ EBH)

The 4READ instruction enable quad throughput of Serial NOR Flash in read mode. The address is latched on rising edge of SCLK, and data of every four bits (interleave on 4 I/O pins) shift out on the falling edge of SCLK at a maximum frequency fQ. The first address byte can be at any location. The address is automatically increased to the next higher address after each byte data is shifted out, so the whole memory can be read out at a single 4READ instruction. The address counter rolls over to 0 when the highest address has been reached. Once writing 4READ instruction, the following address/dummy/data out will perform as 4-bit instead of previous 1-bit.

The sequence of issuing 4READ instruction is: CS# goes low→ sending 4READ instruction→ 24/32-bit address interleave on SIO3, SIO2, SIO1 & SIO0→2+4 dummy cycles→data out interleave on SIO3, SIO2, SIO1 & SIO0→ to end 4READ operation can use CS# to high at any time during data out.

While Program/Erase/Write Status Register cycle is in progress, 4READ instruction is rejected without any impact on the Program/Erase/Write Status Register current cycle.

Figure 9-25 4IO Read Sequence (Command EBH M5-4 ≠ (1,0)) in SPI mode

Note:

- 1. Hi-impedance is inhibited for the two clock cycles.
- 2. M[5-4] = (1,0) is inhibited.
- 3. 32-bit address is required when the device is operation in 4-byte address mode.
- 4. DC bit can set the number of dummy clocks.

4IO Read in QPI mode

The 4READ instruction is also supported in QPI mode. When QPI mode is enabled, the number of dummy clocks is configured by the "Set Read Parameters (C0h)" instruction to accommodate a wide range of applications with different needs for either maximum Fast Read frequency or minimum data access latency. Depending on the Read Parameter Bits P[5:4] setting, the number of dummy clocks can be configured.

"Wrap Around" feature is not available in QPI mode for 4IO Read instruction. To perform a read operation with fixed data length wrap around in QPI mode, a dedicated "Burst Read with Wrap" (0Ch) instruction must be used.

Puya Semiconductor Page 55 of 116

Figure 9-25a 4IO Read in QPI mode Sequence (QPI M5-4 ≠ (1,0))

Note:

- 1. Hi-impedance is inhibited for the two clock cycles.
- 2. M[5-4] = (1,0) is inhibited.
- 3. 32-bit address is required when the device is operation in 4-byte address mode.
- 4. C0H command can set the number of dummy clocks.

4IO Read with "8/16/32/64-Byte Wrap Around" in Standard SPI mode

The 4IO Read instruction can also be used to access a specific portion within a page by issuing a "Set Burst with Wrap" (77h) command prior to EBh. The "Set Burst with Wrap" (77h) command can either enable or disable the "Wrap Around" feature for the following EBh commands. When "Wrap Around" is enabled, the data being accessed can be limited to either an 8, 16, 32 or 64-byte section of a 256-byte page. The output data starts at the initial address specified in the instruction, once it reaches the ending boundary of the 8/16/32/64-byte section, the output will wrap around to the beginning boundary automatically until CS# is pulled high to terminate the command.

The Burst with Wrap feature allows applications that use cache to quickly fetch a critical address and then fill the cache afterwards within a fixed length (8/16/32/64-byte) of data without issuing multiple read commands.

The "Set Burst with Wrap" instruction allows three "Wrap Bits", W6-4 to be set. The W4 bit is used to enable or disable the "Wrap Around" operation while W6-5 is used to specify the length of the wrap around section within a page.

Puya Semiconductor Page 56 of 116

9.26 4IO Read with 4-Byte Address (4READ4B ECH)

The 4IO Read with 4-Byte Address (ECh) instruction is similar to the 4IO Read (EBh) instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the 4IO Read with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

The 4IO Read with 4-Byte Address (ECh) instruction is only supported in Standard SPI mode.

Figure 9-26 4IO Read with 4-Byte Address Sequence (Command ECH M5-4 ≠ (1,0))

Note:

- 1. Hi-impedance is inhibited for the mode clock cycles.
- 2. M[5-4] = (1,0) is inhibited.
- 3. DC bit can set the number of dummy clocks.

Puya Semiconductor Page 57 of 116

9.27 DTR 4IO Read (DTR_4READ EDH)

The DTR 4IO Read (EDh) instruction is similar to the DTR 2IO Read (BDh) instruction except that address and data bits are input and output through four pins IO0, IO1, IO2 and IO3 and four Dummy clocks are required in SPI mode prior to the data output. The Quad I/O dramatically reduces instruction overhead allowing faster random access for code execution (XIP) directly from the Quad SPI.

Figure 9-27 DTR 4IO Read Mode Sequence (Command EDH M5-4 ≠ (1,0))

Note:

- 1. Hi-impedance is inhibited for the mode clock cycles.
- 2. M[5-4] = (1,0) is inhibited.
- 3. 32-bit address is required when the device is operation in 4-byte address mode.
- 4. DC bit can set the number of dummy clocks.

DTR 4IO Read with "8/16/32/64-Byte Wrap Around" in Standard SPI mode

The DTR 4IO Read instruction can also be used to access a specific portion within a page by issuing a "Set Burst Read" (77h) command prior to EDh. The "Set Burst Read" (77h) command can either enable or disable the "Wrap Around" feature for the following EDh commands. When "Wrap Around" is enabled, the data being accessed can be limited to either an 8, 16, 32 or 64-byte section of a 256-byte page. The output data starts at the initial address specified in the instruction, once it reaches the ending boundary of the 8/16/32/64-byte section, the output will wrap around to the beginning boundary automatically until CS# is pulled high to terminate the command.

The Burst with Wrap feature allows applications that use cache to quickly fetch a critical address and then fill the cache afterwards within a fixed length (8/16/32/64-byte) of data without issuing multiple read commands.

The "Set Burst Read" instruction allows three "Wrap Bits", W6-4 to be set. The W4 bit is used to enable or disable the "Wrap Around" operation while W6-5 is used to specify the length of the wrap around section within a page.

DTR 4IO Read (EDh) in QPI Mode

The DTR 4IO Read instruction is also supported in QPI mode. In QPI mode, the bits M7-0 are also considered as dummy clocks.

"Wrap Around" feature is not available in QPI mode for DTR 4IO Read instruction. To perform a read operation with fixed data length wrap around in QPI mode, a dedicated "Burst Read with Wrap" (0Ch) instruction must be used.

Puya Semiconductor Page 58 of 116

Figure 9-27b DTR 4IO Read Mode Sequence (QPI EDH M5-4 ≠ (1,0))

Note:

- 1. Hi-impedance is inhibited for the two clock cycles.
- 2. M[5-4] = (1,0) is inhibited.
- 3. 32-bit address is required when the device is operation in 4-byte address mode.
- 4. C0H command can set the number of dummy clocks.

Puya Semiconductor Page 59 of 116

9.28 DTR 4IO Read with 4-Byte Address (DTR_4READ4B EEH)

The DTR 4IO Read with 4-Byte Address (EEh) instruction is similar to the DTR 4IO Read (EDh) instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the DTR 4IO Read with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

The DTR 4IO Read with 4-Byte Address (EEh) instruction is only supported in Standard SPI mode.

Figure 9-28 DTR 4IO Read with 4-Byte Address Sequence (Command EEH M5-4 ≠ (1,0))

Note: DC bit can set the number of dummy clocks.

Figure 9-28a DTR 4IO Read with 4-Byte Address Sequence (QPI EEH M5-4 ≠ (1,0))

Note:

- 1. Hi-impedance is inhibited for the mode clock cycles. 2. M[5-4] = (1,0) is inhibited.
- 2. DC bit can set the number of dummy clocks.

Puya Semiconductor Page 60 of 116

9.29 Set Burst Length (SBL 77H)

The Set Burst with Wrap command is used in conjunction with "4IO Read" and "4IO Word Read" command to access a fixed length of 8/16/32/64-byte section within a 256-byte page, in standard SPI mode.

The Set Burst with Wrap command sequence: CS# goes low \rightarrow Send Set Burst with Wrap command \rightarrow Send 24/32 dummy bits \rightarrow Send 8 bits "Wrap bits" \rightarrow CS# goes high.

MG ME	W ²	!= 0	W4=1 (default)		
W6,W5	Wrap Around	Wrap Length	Wrap Around	Wrap Length	
0,0	Yes	8-byte	No	N/A	
0,1	Yes	16-byte	No	N/A	
1,0	Yes	32-byte	No	N/A	
1,1	Yes	64-byte	No	N/A	

If the W6-W4 bits are set by the Set Burst with Wrap command, all the following "4IO Read" command will use the W6-W4 setting to access the 8/16/32/64-byte section within any page. To exit the "Wrap Around" function and return to normal read operation, another Set Burst with Wrap command should be issued to set W4=1. The default value of W4 upon power on or after a software/hardware reset is 1.

Figure 9-29 Set Burst Read (SBL) Sequence (Command 77H)

Note: 32-bit dummy bits are required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 61 of 116

9.30 Set Read Parameters (C0h)

In QPI mode, to accommodate a wide range of applications with different needs for either maximum read frequency or minimum data access latency, "Set Read Parameters (C0h)" instruction can be used to configure the number of dummy clocks for "Fast Read (0Bh)", "4IO Read (EBh)" & "Burst Read with Wrap (0Ch)" & "Read SFDP Mode (5Ah)" instructions, and to configure the number of bytes of "Wrap Length" for the "Burst Read with Wrap (0Ch)" instruction.

In Standard SPI mode, the "Set Read Parameters (C0h)" instruction is not accepted. The dummy clocks for various Fast Read instructions in Standard/Dual/Quad SPI mode are configured by DC bit. The "Wrap Length" is set by W5-4 bit in the "Set Burst with Wrap (77h)" instruction. This setting will remain unchanged when the device is switched from Standard SPI mode to QPI mode.

The default "Wrap Length" after a power up or a Reset instruction and the default number of dummy clocks can refer to the following table. The number of dummy clocks is only programmable for "Fast Read (0Bh)", "4IO Read (EBh)" & "Burst Read with Wrap (0Ch)" instructions in the QPI mode. Whenever the device is switched from SPI mode to QPI mode, the number of dummy clocks should be set again, prior to any 0Bh, EBh or 0Ch instructions.

P5-P4	Dummy Clocks	P1-P0	Wrap Length
0,0	10	0,0	8-byte
0,1	4	0,1	16-byte
1,0	6	1,0	32-byte
1,1	8	1,1	64-byte

Figure 9-30 Set Read Parameters Sequence (QPI)

Puya Semiconductor Page 62 of 116

9.31 Burst Read with Wrap (0Ch)

The "Burst Read with Wrap (0CH)" command provides an alternative way to perform the read operation with "Wrap Around" in QPI mode. This command is similar to the "Fast Read (0BH)" command in QPI mode, except the addressing of the read operation will "Wrap Around" to the beginning boundary of the "Wrap Around" once the ending boundary is reached. The "Wrap Length" and the number of dummy clocks can be configured by the "Set Read Parameters (C0H)" command.

Figure 9-31 Burst Read with Wrap Sequence (QPI)

Note:

32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 63 of 116

9.32 DTR Burst Read with Wrap (0Eh)

The "DTR Burst Read with Wrap (0EH)" command provides an alternative way to perform the read operation with "Wrap Around" in QPI mode. This command is similar to the "DTR Fast Read (0DH)" command in QPI mode, except the addressing of the read operation will "Wrap Around" to the beginning boundary of the "Wrap Around" once the ending boundary is reached. The "Wrap Length" and the number of dummy clocks can be configured by the "Set Read Parameters (C0H)" command.

Figure 9-32 Burst Read with Wrap Sequence (QPI)

Note:

- 1. 32-bit address is required when the device is operation in 4-byte address mode.
- 2. DC bit can set the number of dummy clocks.

Puya Semiconductor Page 64 of 116

9.33 Data Learning Pattern

The data learning pattern supports system/memory controller determine valid window of data output more easily and improve data capture reliability while the flash memory is running in high frequency.

Data learning pattern can be enabled or disabled by setting the bit4 of Configure Register (DLP bit). Once the DLP bit is set, the data learning pattern is inputted into dummy cycles.

The data learning pattern is a fixed 8-bit data pattern (00110100). For STR (single transfer rate) instructions, the complete 8 bits will start to output right after the last address bit. While dummy cycle is not sufficient of 8 cycles, the rest of the DLP bits will be cut. For DTR (double transfer rate) instructions, the complete 8 bits will start to output during the last 4 dummy cycle.

Figure 9-33 Fast Read with DLP bits output Sequence

Note:

- 1. The DLP bit is also valid for 4-byte EDH and EEH instruction and QPI 4IO DTR read instruction.
- 2. DLP bits will delay 2 SCLK to output when DC=1.

Puya Semiconductor Page 67 of 116

9.34 Enable QPI (QPIEN 38H)

The device support both Standard/Dual/Quad SPI and QPI mode. The "Enable QPI (38H)" command can switch the device from SPI mode to QPI mode. "Enable QPI (38H)" command must be issued. When the device is switched from SPI mode to QPI mode, the existing Write Enable Latch and Program/Erase Suspend status, and the Wrap Length setting will remain unchanged.

Figure 9-34 Enable QPI Sequence (38H)

9.35 Disable QPI (FFH)

To exit the QPI mode and return to Standard/Dual/Quad SPI mode, the "Disable QPI (FFH)" command must be issued. When the device is switched from QPI mode to SPI mode, the existing Write Enable Latch and Program/Erase Suspend status, and the Wrap Length setting will remain unchanged.

Figure 9-35 Disable QPI Sequence (QPI)

Puya Semiconductor Page 68 of 116

9.36 Sector Erase (SE 20H)

The Sector Erase (SE) instruction is for erasing the data of the chosen sector to be "1". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Sector Erase (SE). Any address of the sector is a valid address for Sector Erase (SE) instruction. The CS# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed. Address bits [Am-A12] (Am is the most significant address) select the sector address.

The sequence of issuing SE instruction is: CS# goes low \rightarrow sending SE instruction code \rightarrow 3/4-byte address on SI \rightarrow CS# goes high.

The self-timed Sector Erase Cycle time (tSE) is initiated as soon as Chip Select (CS#) goes high. The Write in progress (WIP) bit still can be check out during the Sector Erase cycle is in progress. The WIP sets 1 during the tSE timing, and sets 0 when Sector Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the sector is protected by BP4, BP3, BP2, BP1, BP0 bits, the Sector Erase (SE) instruction will not be executed on the sector.

Figure 9-36 Sector Erase (SE) Sequence (Command 20H)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-36a Sector Erase (SE) Sequence (QPI)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 69 of 116

9.37 Sector Erase with 4-Byte Address (SE4B 21H)

The Sector Erase with 4-Byte Address instruction is similar to the Sector Erase instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Sector Erase with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

Figure 9-37 Sector Erase with 4-Byte Address Sequence (Command 21H)

Puya Semiconductor Page 70 of 116

9.38 32K Block Erase (BE32K 52H)

The 32K Block Erase (BE32K) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 32K-byte block erase operation. A Write Enable (WREN) instruction must be executed to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE32K). Any address of the block is a valid address for Block Erase (BE32K) instruction. The CS# must go high exactly at the byte boundary (the least significant bit of address byte has been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE32K instruction is: CS# goes low \rightarrow sending BE32K instruction code \rightarrow 3/4-byte address on SI \rightarrow CS# goes high.

Figure 9-38 Block Erase 32K(BE32K) Sequence (Command 52H)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-38a Block Erase 32K(BE32K) Sequence (QPI)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 71 of 116

9.39 32K Block Erase with 4-Byte Address (BE32K4B 5CH)

The 32K Block Erase with 4-Byte Address instruction is similar to the 32K Block Erase instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the 32K Block Erase with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

Figure 9-39 Block Erase 32K with 4-Byte Address (BE32K4B) Sequence (Command 5CH)

Puya Semiconductor Page 72 of 116

9.40 Block Erase (BE D8H)

The Block Erase (BE) instruction is for erasing the data of the chosen block to be "1". The instruction is used for 64K-byte block erase operation. A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Block Erase (BE). Any address of the block is a valid address for Block Erase (BE) instruction. The CS# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing BE instruction is: CS# goes low→ sending BE instruction code→ 3/4-byte address on SI→CS# goes high.

The self-timed Block Erase Cycle time (tBE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Block Erase cycle is in progress. The WIP sets 1 during the tBE timing, and sets 0 when Block Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the block is protected by BP4, BP3, BP2, BP1, BP0 bits, the Block Erase (BE32K/BE) instruction will not be executed on the block.

Figure 9-40 Block Erase (BE) Sequence (Command D8H)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-40a Block Erase (BE) Sequence (QPI)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 73 of 116

9.41 Block Erase with 4-Byte Address (BE4B DCH)

The Block Erase with 4-Byte Address instruction is similar to the Block Erase instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-byte address mode or 4-byte address mode, the Block Erase with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

Figure 9-41 Block Erase with 4-Byte Address Sequence (Command DCH)

Puya Semiconductor Page 74 of 116

9.42 Chip Erase (CE 60H/C7H)

The Chip Erase (CE) instruction is for erasing the data of the whole chip to be "1". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Chip Erase (CE). The CS# must go high exactly at the byte boundary (the latest eighth of address byte been latched-in); otherwise, the instruction will be rejected and not executed.

The sequence of issuing CE instruction is: CS# goes low→ sending CE instruction code→ CS# goes high.

The self-timed Chip Erase Cycle time (tCE) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Chip Erase cycle is in progress. The WIP sets 1 during the tCE timing, and sets 0 when Chip Erase Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the chip is protected by BP4, BP3, BP2, BP1, BP0 bits, the Chip Erase (CE) instruction will not be executed.

It is noted that in Individual Protect Mode (WPS=1), the GBULK(98H) instruction must previously have been executed before each Chip Erase instruction.

Figure 9-42 Chip Erase (CE) Sequence (Command 60H or C7H)

Figure 9-42a Chip Erase (CE) Sequence (QPI)

9.43 Page Program (PP 02H)

The Page Program (PP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Page Program (PP). The device programs only the last 256 data bytes sent to the device. If the entire 256 data bytes are going to be programmed, A7-A0 (The eight least significant address bits) should be set to 0. If the eight least significant address bits (A7-A0) are not all 0, all transmitted data going beyond the end of the current page are programmed from the start address of the same page (from the address A7-A0 are all 0). If more than 256 bytes are sent to the device, the data of the last 256-byte is programmed at the request page and previous data will be disregarded. If less than 256 bytes are sent to the device, the data is programmed at the requested address of the page.

For the very best performance, programming should be done in full pages of 256 bytes aligned on 256 byte

Puya Semiconductor Page 75 of 116

boundaries with each Page being programmed only once. Using the Page Program (PP) command to load an entire page, within the page boundary, will save overall programming time versus loading less than a page into the program buffer.

It is possible to program from one byte up to a page size in each Page programming operation. Please refer to the P25Q serial flash application note for multiple byte program operation within one page.

The sequence of issuing PP instruction is: CS# goes low \rightarrow sending PP instruction code \rightarrow 3/4-byte address on SI \rightarrow at least 1-byte on data on SI \rightarrow CS# goes high.

The CS# must be kept low during the whole Page Program cycle; The CS# must go high exactly at the byte boundary (the latest eighth bit of data being latched in), otherwise the instruction will be rejected and will not be executed.

The self-timed Page Program Cycle time (tPP) is initiated as soon as Chip Select (CS#) goes high. The Write in Progress (WIP) bit still can be checked during the Page Program cycle is in progress. The WIP sets 1 during the tPP timing, and sets 0 when Page Program Cycle is completed, and the Write Enable Latch (WEL) bit is reset. If the page is protected by BP4, BP3, BP2, BP1, BP0 bits, the Page Program (PP) instruction will not be executed.

Figure 9-43 Page Program (PP) Sequence (Command 02H)

CS#

Note:32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-43a Page Program (PP) Sequence (QPI)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 76 of 116

9.44 Page Program with 4-Byte Address (PP4B 12H)

The Page Program with 4-Byte Address instruction is similar to the Page Program instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Page Program with 4-Byte Address instruction will always require 32- bit address to access the entire 256Mb memory

Figure 9-44 Page Program with 4-Byte Address Sequence (Command 12H)

Puya Semiconductor Page 77 of 116

9.45 Quad Page Program (QPP 32H)

The Quad Page Program (QPP) instruction is for programming the memory to be "0". A Write Enable (WREN)

instruction must execute to set the Write Enable Latch (WEL) bit. The Quad Page Programming takes four pins: SIO0, SIO1, SIO2, and SIO3 as data input, which can improve programmer performance and the effectiveness of application. The QPP operation frequency supports as fast as fQPP. The other function descriptions are as same as standard page program.

The sequence of issuing QPP instruction is: CS# goes low \rightarrow sending QPP instruction code \rightarrow 3/4-byte address on SIO0 \rightarrow at least 1-byte on data on SIO[3:0] \rightarrow CS# goes high.

Figure 9-45 Quad Page Program (QPP) Sequence (Command 32H)

Puya Semiconductor Page 78 of 116

9.46 Quad Page Program with 4-Byte Address (QPP4B 34H)

The Quad Page Program with 4-Byte Address instruction is similar to the Quad Page Program instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Quad Input Page Program with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

Figure 9-46 Quad Page Program with 4-Byte Address Sequence (Command 34H)

Puya Semiconductor Page 79 of 116

9.47 Quad-In Page Program (QIPP C2H)

The Quad-In Page Program (QIPP) instruction is for programming the memory to be "0". A Write Enable (WREN) instruction must execute to set the Write Enable Latch (WEL) bit before sending the Quad-In Page Program (QIPP). The Quad-In Page Programming takes four pins: SIO0, SIO1, SIO2, and SIO3 as address and data input, which can improve programmer performance and the effectiveness of application. The QIPP operation frequency supports as fast as fQPP. The other function descriptions are as same as standard page program.

The sequence of issuing QPP instruction is: CS# goes low \rightarrow sending QIPP instruction code \rightarrow 3/4-byte address on SIO[3:0] \rightarrow at least 1-byte on data on SIO[3:0] \rightarrow CS# goes high.

CS# 10 11 12 13 SCLK 24-bit address Byte2 Byte3 Byte4 Byte1 SI(IO0) С2Н SO(IO1) IO2 IO3 CS# SCLK Byte11 Byte12 Byte253 SI(IO0) SO(IO1) IO2 IO3

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 80 of 116

9.48 Quad-In Page Program with 4-Byte Address (QIPP4B 3EH)

The Quad-In Page Program with 4-Byte Address instruction is similar to the Quad-In Page Program instruction except that it requires 32-bit address instead of 24-bit address. No matter the device is operating in 3-Byte Address Mode or 4-byte Address Mode, the Quad Input Page Program with 4-Byte Address instruction will always require 32-bit address to access the entire 256Mb memory.

Figure 9-48 Quad-In Page Program with 4-Byte Address Sequence (Command 3EH)

Puya Semiconductor Page 81 of 116

9.49 Erase Security Registers (ERSCUR 44H)

The product provides three 1024-byte Security Registers which can be erased and programmed individually. These registers may be used by the system manufacturers to store security and other important information separately from the main memory array. The Erase Security Registers command is similar to Sector/Block Erase command. A Write Enable (WREN) command must previously have been executed to set the Write Enable Latch (WEL) bit.

The Erase Security Registers command sequence: CS# goes low \rightarrow sending ERSCUR instruction \rightarrow sending 24/32-bit address \rightarrow CS# goes high.

CS# must be driven high after the eighth bit of the command code has been latched in; otherwise the Erase Security Registers command is not executed. As soon as CS# is driven high, the self-timed Erase Security Registers cycle (tSE) is initiated. While the Erase Security Registers cycle is in progress, the Status Register may be read to check the value of the Write in Progress (WIP) bit. The Write in Progress (WIP) bit is 1 during the self-timed Erase Security Registers cycle, and is 0 when it is completed. The Security Registers Lock Bit (LB3-1) in the Status Register can be used to OTP protect the security registers. Once the LB bit is set to 1, the Security Registers will be permanently locked; the Erase Security Registers command will be ignored.

Address	A23/31-16	A15-12	A11-10	A9-0
Security Register #1	00H/0000H	0001	00	Don't care
Security Register #2	00H/0000H	0010	00	Don't care
Security Register #3	00H/0000H	0011	00	Don't care

Figure 9-49 Erase Security Registers (ERSCUR) Sequence (Command 44H)

Figure 9-49a Erase Security Registers (ERSCUR) Sequence (QPI 44H)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 82 of 116

9.50 Program Security Registers (PRSCUR 42H)

The Program Security Registers command is similar to the Page Program command. It allows from 1 to 1024 bytes Security Registers data to be programmed. A Write Enable (WREN) command must previously have been executed to set the Write Enable Latch (WEL) bit before sending the Program Security Registers command.

The Program Security Registers command sequence: CS# goes low \rightarrow sending PRSCUR instruction \rightarrow sending 24/32 bit address \rightarrow sending at least one byte data \rightarrow CS# goes high.

As soon as CS# is driven high, the self-timed Program Security Registers cycle (whose duration is tPP) is initiated. While the Program Security Registers cycle is in progress, the Status Register may be read to check the value of the Write in Progress (WIP) bit. The Write in Progress (WIP) bit is 1 during the self-timed Program Security Registers cycle, and is 0 when it is completed.

If the Security Registers Lock Bit (LB3-1) is set to 1, the Security Registers will be permanently locked. Program Security Registers command will be ignored.

Address	A23/31-16	A15-12	A11-10	A9-0
Security Register #1	00H/0000H	0001	00	Byte Address
Security Register #2	00H/0000H	0010	00	Byte Address
Security Register #3	00H/0000H	0011	00	Byte Address

Figure 9-50a Program Security Registers (PRSCUR) Sequence (QPI 42H)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 83 of 116

9.51 Read Security Registers (RDSCUR 48H)

The Read Security Registers command is similar to Fast Read command. The command is followed by a 3/4-byte address (A23/31-A0) and a dummy byte, each bit being latched-in during the rising edge of SCLK. Then the memory content, at that address, is shifted out on SO, each bit being shifted out, at a Max frequency fC, during the falling edge of SCLK. The first byte addressed can be at any location. The address is automatically incremented to the next higher address after each byte of data is shifted out. Once the A9-A0 address reaches the last byte of the register (Byte 3FFH), it will reset to 000H, the command is completed by driving CS# high.

The sequence of issuing RDSCUR instruction is: CS# goes low \rightarrow sending RDSCUR instruction \rightarrow sending 24/32 bit address \rightarrow 8 bit dummy byte \rightarrow Security Register data out on SO \rightarrow CS# goes high.

Address	A23/31-16	A15-12	A11-10	A9-0
Security Register #1	00H/0000H	0001	00	Byte Address
Security Register #2	00H/0000H	0010	00	Byte Address
Security Register #3	00H/0000H	0011	00	Byte Address

Figure 9-51 Read Security Registers (RDSCUR) Sequence (Command 48H)

Note:32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 84 of 116

9.52 Deep Power-down (DP B9H)

The Deep Power-down (DP) instruction is for setting the device on the minimizing the power consumption (to entering the Deep Power-down mode), the standby current is reduced from ISB1 to ISB2). The Deep Power-down mode requires the Deep Power-down (DP) instruction to enter, during the Deep Power-down mode, the device is not active and all Write/Program/Erase instruction are ignored. When CS# goes high, it's only in standby mode not deep power-down mode. It's different from Standby mode.

The sequence of issuing DP instruction is: CS# goes low→ sending DP instruction code→ CS# goes high.

Once the DP instruction is set, all instruction will be ignored except the Release from Deep Power-down mode (RDP), Read Electronic Signature (RES) instruction (RES instruction to allow the ID been read out), and software reset instruction. When Power- down, the deep power-down mode automatically stops, and when power-up, the device automatically is in standby mode. For RDP instruction the CS# must go high exactly at the byte boundary (the latest eighth bit of instruction code been latched-in); otherwise, the instruction will not be executed. As soon as Chip Select (CS#) goes high, a delay of tDP is required before entering the Deep Power-down mode and reducing the current to I_{DPD}.

In SPI Deep Power-down mode, the SPI software reset instruction(66H+99H) can exit Deep Power-down mode; while in QPI Deep Power-down mode, the QPI software reset instruction(66H+99H) can exit Deep Power-down mode.

Figure 9-52 Deep Power-down (DP) Sequence (Command B9H)

Figure 9-52a Deep Power-down (DP) Sequence (QPI)

Puya Semiconductor Page 85 of 116

9.53 Release form Deep Power-Down (RDP), Read Electronic Signature (RES ABH)

The Release from Deep Power-down (RDP) instruction is terminated by driving Chip Select (CS#) High. When Chip Select (CS#) is driven high, the device is put in the Stand-by Power mode. If the device was not previously in the Deep Power-down mode, the transition to the Stand-by Power mode is immediate. If the device was previously in the Deep Power-down mode, though, the transition to the Stand-by Power mode is delayed by tRES2, and Chip Select (CS#) must remain High for at least tRES2(max). Once in the Stand-by Power mode, the device waits to be selected, so that it can receive, decode and execute instructions.

RES instruction is for reading out the old style of 8-bit Electronic Signature, whose values are shown as table of ID Definitions. This is not the same as RDID instruction. It is not recommended to use for new design. For new design, please use RDID instruction. Even in Deep power-down mode, the RDP and RES are also allowed to be executed, and even the device is in progress of program/erase/write cycle; there's no effect on the current program/erase/ write cycle in progress.

The RES instruction is ended by CS# goes high after the ID been read out at least once. The ID outputs repeatedly if continuously send the additional clock cycles on SCLK while CS# is at low. If the device was not previously in Deep Power-down mode, the device transition to standby mode is immediate. If the device was previously in Deep Power-down mode, there's a delay of tRES2 to transit to standby mode, and CS# must remain to high at least tRES2 (max). Once in the standby mode, the device waits to be selected, so it can be received, decode, and execute instruction.

The RDP instruction is for releasing from Deep Power-Down Mode.

9.54 Read Electronic Manufacturer ID & Device ID (REMS 90H)

The REMS instruction returns both the JEDEC assigned manufacturer ID and the device ID. The Device ID values are listed in "Table ID Definitions".

The REMS instruction is initiated by driving the CS# pin low and sending the instruction code "90h" followed by a 24-bit address (A23 -A0) of 000000H. After which the manufacturer ID for PUYA (85h) and the device ID are shifted out on the falling edge of SCLK with the most significant bit (MSB) first. While CS# is low, the manufacturer and device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS# high.

Figure 9-54 Read Electronic Manufacturer & Device ID (REMS) Sequence (Command 90H)

Figure 9-54a Read Electronic Manufacturer & Device ID (REMS) Sequence (QPI)

Puya Semiconductor Page 88 of 116

9.55 Dual I/O Read Electronic Manufacturer ID & Device ID (DREMS 92H)

The DREMS instruction is similar to the REMS command and returns the JEDEC assigned manufacturer ID which takes two pins: SIO0, SIO1 as address input and ID output I/O

The instruction is initiated by driving the CS# pin low and shift the instruction code "92h" followed by a 24/32-bit address (A23/A31-A0) of 000000h and 1byte dummy, but with the capability to input the Address bits two bits per clock. After which, the Manufacturer ID for PUYA (85h) and the Device ID are shifted out on the falling edge of SCLK with most significant bit (MSB) first. The Manufacturer and Device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS# high.

Figure 9-55 DUAL I/O Read Electronic Manufacturer & Device ID (DREMS) Sequence (Command 92H)

Note: 32-bit address (0000 0000H) are required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 89 of 116

9.56 Quad I/O Read Electronic Manufacturer ID & Device ID (QREMS 94H)

The QREMS instruction is similar to the REMS command and returns the JEDEC assigned manufacturer ID which takes four pins: SIO0, SIO1, SIO2, SIO3 as address input and ID output I/O

The instruction is initiated by driving the CS# pin low and shift the instruction code "94h" followed by a 24/32-bit address (A23/A31-A0) of 000000h, and 3 bytes dummy, but with the capability to input the Address bits four bits per clock. After which, the Manufacturer ID for PUYA (85h) and the Device ID are shifted out on the falling edge of SCLK with most significant bit (MSB) first. The Manufacturer and Device IDs can be read continuously, alternating from one to the other. The instruction is completed by driving CS# high.

Figure 9-56 QUAD I/O Read Electronic Manufacturer & Device ID (QREMS) Sequence (Command 94H)

Note: 32-bit address (0000_0000H) are required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 90 of 116

9.57 Read Identification (RDID 9FH)

The RDID instruction is for reading the manufacturer ID of 1-byte and followed by Device ID of 2-byte. The PUYA Manufacturer ID and Device ID are list as "Table. ID Definitions".

The sequence of issuing RDID instruction is: CS# goes low \rightarrow sending RDID instruction code \rightarrow 24-bits ID data out on SO \rightarrow to end RDID operation can use CS# to high at any time during data out. While Program/Erase operation is in progress, it will not decode the RDID instruction, so there's no effect on the cycle of program/erase operation which is currently in progress. When CS# goes high, the device is at standby stage.

Puya Semiconductor Page 91 of 116

9.58 Program/Erase Suspend (75H)

The Suspend instruction interrupts a Page Program, Page Erase, Sector Erase, or Block Erase operation to allow access to the memory array. After the program or erase operation has entered the suspended state, the memory array can be read except for the page being programmed or the sector or block being erased.

Readable Area of Memory While a Program or Erase Operation is Suspended

Suspended Operation	Readable Region of Memory Array
Page Program	All but the Page being programmed
Sector Erase(4KB)	All but the 4KB Sector being erased
Block Erase(32KB)	All but the 32KB Block being erased
Block Erase(64KB)	All but the 64KB Block being erased

When the Serial NOR Flash receives the Suspend instruction, there is a latency of tPSL or tESL before the Write Enable Latch (WEL) bit clears to "0" and the SUS sets to "1", after which the device is ready to accept one of the commands listed in "Table Acceptable Commands During Program/Erase Suspend after tPSL/tESL" (e.g. FAST READ). Refer to "AC Characteristics" for tPSL and tESL timings. "Table Acceptable Commands During Suspend (tPSL/tESL not required)" lists the commands for which the tPSL and tESL latencies do not apply. For example, RDSR, RDSCUR, RSTEN, and RST can be issued at any time after the Suspend instruction.

Status Register bit 15 (SUS) can be read to check the suspend status. The SUS (Program/Erase Suspend Bit) sets to "1" when a program or erase operation is suspended. The SUS clears to "0" when the program or erase operation is resumed

Puya Semiconductor Page 93 of 116

9.59 Erase Suspend to Program

The "Erase Suspend to Program" feature allows Page Programming while an erase operation is suspended. Page Programming is permitted in any unprotected memory except within the sector of a suspended Sector Erase operation or within the block of a suspended Block Erase operation. The Write Enable (WREN) instruction must be issued before any Page Program instruction.

A Page Program operation initiated within a suspended erase cannot itself be suspended and must be allowed to finish before the suspended erase can be resumed. The Status Register can be polled to determine the status of the Page Program operation. The WEL and WIP bits of the Status Register will remain "1" while the Page Program operation is in progress and will both clear to "0" when the Page Program operation completes.

Figure 9-59 Suspend to Read/Program Latency

Figure 9-59a Suspend to Read/Program Latency(QPI)

Notes:

- 1. Please note that Program only available after the Erase-Suspend operation
- 2. To check suspend ready information, please read status register bit15 (SUS2) and bit10(SUS1)

Puya Semiconductor Page 94 of 116

9.60 Program Resume and Erase Resume (7AH)

The Resume instruction resumes a suspended Page Program, Page Erase, Sector Erase, or Block Erase operation. Before issuing the Resume instruction to restart a suspended erase operation, make sure that there is no Page Program operation in progress.

Immediately after the Serial NOR Flash receives the Resume instruction, the WEL and WIP bits are set to "1" and the SUS2 or SUS1 is cleared to "0". The program or erase operation will continue until finished ("Resume to Read Latency") or until another Suspend instruction is received. A resume-to-suspend latency of tPRS or tERS must be observed before issuing another Suspend instruction ("Resume to Suspend Latency").

Figure 9-60 Resume to Read Latency

Figure 9-60a Resume to Read Latency (QPI)

9.61 No Operation (NOP)

The "No Operation" command is only able to terminate the Reset Enable (RSTEN) command and will not affect any other command.

The SIO[3:1] are don't care.

Puya Semiconductor Page 95 of 116

9.62 Individual Block Lock (SBLK 36H)

The Individual Block Lock provides an alternative way to protect the memory array from adverse Erase/Program. In order to use the Individual Block Locks, the WPS bit in Configure Register must be set to 1. If WPS=0, the write protection will be determined by the combination of CMP, BP[4:0] bits in the Status Registers. The Individual Block Lock bits are volatile bits. The default values after device power up or after a Reset are 1, so the entire memory array is being protected.

The SBLK instruction is for write protection a specified block (or sector) of memory, using AMAX-A16 or (AMAX-A12) address bits to assign a 64Kbyte block (or 4K bytes sector) to be protected as read only.

The WREN (Write Enable) instruction is required before issuing SBLK instruction.

The sequence of issuing SBLK instruction is: CS# goes low \rightarrow send SBLK (36h) instruction \rightarrow send 3/4-byte address assign one block (or sector) to be protected on SI pin \rightarrow CS# goes high. The CS# must go high exactly at the byte boundary, otherwise the instruction will be rejected and not be executed.

Figure 9-62 Individual Block Lock (Command 36H)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-62a Individual Block Lock(QPI)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 96 of 116

9.63 Individual Block Unlock (SBULK 39H)

The Individual Block Lock provides an alternative way to protect the memory array from adverse Erase/Program. In order to use the Individual Block Locks, the WPS bit in Configure Register must be set to 1. If WPS=0, the write protection will be determined by the combination of CMP, BP[4:0] bits in the Status Registers. The Individual Block Lock bits are volatile bits. The default values after device power up or after a Reset are 1, so the entire memory array is being protected.

The SBULK instruction will cancel the block (or sector) write protection state using AMAX-A16 or (AMAX-A12) address bits to assign a 64Kbyte block (or 4K bytes sector) to be unprotected. The WREN (Write Enable) instruction is required before issuing SBULK instruction.

The sequence of issuing SBULK instruction is: CS# goes low \rightarrow send SBULK (39h) instruction \rightarrow send 3/4-byte address assign one block (or sector) to be protected on SI pin \rightarrow CS# goes high. The CS# must go high exactly at the byte boundary, otherwise the instruction will be rejected and not be executed.

Figure 9-63 Individual Block Unlock (Command 39H)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-63a Individual Block Unlock (QPI)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 97 of 116

9.64 Read Block Lock Status (RDBLK 3DH)

Figure 9-64 Read Block Lock Status (Command 3DH)

The Individual Block Lock provides an alternative way to protect the memory array from adverse Erase/Program. In order to use the Individual Block Locks, the WPS bit in Configure Register must be set to 1. If WPS=0, the write protection will be determined by the combination of CMP, BP[4:0] bits in the Status Registers. The Individual Block Lock bits are volatile bits. The default values after device power up or after a Reset are 1, so the entire memory array is being protected.

The RDBLOCK instruction is for reading the status of protection lock of a specified block (or sector), using AMAX-A16 (or AMAX-A12) address bits to assign a 64K bytes block (4K bytes sector) and read protection lock status bit which the first byte of Read-out cycle. The status bit is"1" to indicate that this block has be protected, that user can read only but cannot write/program /erase this block. The status bit is "0" to indicate that this block hasn't be protected, and user can read and write this block.

The sequence of issuing RDBLOCK instruction is: CS# goes low → send RDBLOCK (3Dh) instruction → send 3/4-byte address to assign one block on SI pin → read block's protection lock status bit on SO pin → CS# goes high. Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction.

CS#

Note:32-bit address is required when the device is operation in 4-byte address mode.

Figure 9-64a Read Block Lock Status (QPI)

Note: 32-bit address is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 98 of 116

9.65 Global Block Lock (GBLK 7EH)

The GBLK instruction is for enable the lock protection block of the whole chip. The WREN (Write Enable) instruction is required before issuing GBLK instruction.

The sequence of issuing GBLK instruction is: CS# goes low \rightarrow send GBLK (7Eh) instruction \rightarrow CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode. The CS# must go high exactly at the byte boundary, otherwise, the instruction will be rejected and not be executed.

Figure 9-65 Global Block Lock (Command 7EH)

Figure 9-65a Global Block Lock (QPI)

Puya Semiconductor Page 99 of 116

9.66 Global Block Unlock (GBULK 98H)

The GBULK instruction is for disable the lock protection block of the whole chip. The WREN (Write Enable) instruction is required before issuing GBULK instruction.

The sequence of issuing GBULK instruction is: CS# goes low \rightarrow send GBULK (98h) instruction \rightarrow CS# goes high.

Both SPI (8 clocks) and QPI (2 clocks) command cycle can accept by this instruction. The SIO[3:1] are "don't care" in SPI mode. The CS# must go high exactly at the byte boundary, otherwise, the instruction will be rejected and not be executed.

Figure 9-66 Global Block Unlock (Command 98H)

Figure 9-66a Global Block Unlock (QPI)

Puya Semiconductor Page 100 of 116

9.67 Software Reset (RSTEN/RST 66H/99H)

The Software Reset operation combines two instructions: Reset-Enable (RSTEN) command and Reset (RST) command. It returns the device to a standby mode. All the volatile bits and settings will be cleared then, which makes the device return to the default status as power on.

To execute Reset command (RST), the Reset-Enable (RSTEN) command must be executed first to perform the Reset operation. If there is any other command to interrupt after the Reset-Enable command, the Reset-Enable will be invalid. The SIO[3:1] are "don't care".

If the Reset command is executed during program or erase operation, the operation will be disabled, the data under processing could be damaged or lost.

Figure 9-67 Software Reset Recovery

Figure 9-67a Reset Sequence

Figure 9-67b Reset Sequence (QPI)

Puya Semiconductor Page 101 of 116

9.68 RESET

Driving the RESET# (for 16-pin package) pin low for a period of tRLRH or longer will reset the device. After reset cycle, the device is at the following states:

- Standby mode
- All the volatile bits such as WEL/WIP/SRAM lock bit will return to the default status as power on.

If the device is under programming or erasing, driving the RESET# pin low will also terminate the operation and data could be lost. During the resetting cycle, the SO data becomes high impedance and the current will be reduced to minimum.

Figure 9-68 RESET Timing

RESET Timing (Other Operation)

Symbol	Parameter	Min	Typ ⁽²⁾	Max	Unit
tRHSL	Reset# high before CS# low	1			us
tRS	Reset# setup time	15			ns
tRH	Reset# hold time	15			ns
tRLRH	Reset# low pulse width	1			us
	Reset Recover time (Except erase/WRSR/WRSR1/WRCR)			30	us
tREADY2	Reset Recover time (For WRSR/WRSR1/WRCR)		2 ⁽¹⁾	12	ms
	Reset Recover time (For erase operation)		5 ⁽¹⁾	12	ms

Note:

- 1. Suggest to add checking SR WIP Bit to make sure Reset flow finished.
- 2. Typical value at 3.0V @ 25°C.

Puya Semiconductor Page 102 of 116

9.69 Reset Signaling Protocol

The Reset Signaling Protocol is another method to issue reset function, which consists of two phases: reset request, and completion (a device internal reset).

Reset Request

- 1. CS# is driven active low to select the SPI target (Note1),
- 2. Clock (SCLK) remains stable in either a high or low state (Note 2),
- 3. SI / IO0 is driven low by the bus initiator, simultaneously with CS# going active low, (Note 3), and
- 4. CS# is driven inactive (Note 4).

Repeat the steps 1-4 each time alternating the state of SI (Note 5).

NOTE 1 This powers up the SPI target.

NOTE 2 This prevents any confusion with a command, as no command bits are transferred (clocked).

NOTE 3 No SPI bus target drives SI during CS# low before a transition of SCK, i.e., target streaming output active is not allowed until after the first edge of SCK.

NOTE 4 The target captures the state of SI on the rising edge of CS#.

NOTE 5 SI is low on the first CS#, high on the second, low on the third, high on the fourth (This provides a 5h pattern, to differentiate it from random noise).

Reset Completion

After the fourth CS# pulse, the target triggers its internal reset.

Figure 9-69 Timing Diagram and Timing Parameters

Puya Semiconductor Page 103 of 116

9.70 Read Unique ID (RUID 4BH)

The Read Unique ID command accesses a factory-set read-only 128bit number that is unique to each PY25R256HB device. The Unique ID can be used in conjunction with user software methods to help prevent copying or cloning of a system.

The Read Unique ID command sequence: CS# goes low →sending Read Unique ID command →Address Byte1 →Address Byte2 →Address Byte3 →Dummy Byte→128bit Unique ID Out →CS# goes high.

The command sequence is show below.

Figure 9-70 Read Unique ID (RUID) Sequence (Command 4BH)

Note: 4 bytes address 0000_0000H is required when the device is operation in 4-byte address mode.

Figure 9-70a Read Unique ID (RUID) Sequence (QPI 4BH)

Note: 4 bytes address 0000_0000H is required when the device is operation in 4-byte address mode.

Puya Semiconductor Page 104 of 116

9.71 Read SFDP Mode (RDSFDP 5AH)

The Serial Flash Discoverable Parameter (SFDP) standard provides a consistent method of describing the functional and feature capabilities of serial flash devices in a standard set of internal parameter tables. These parameter tables can be interrogated by host system software to enable adjustments needed to accommodate divergent features from multiple vendors. The concept is similar to the one found in the Introduction of JEDEC Standard, JESD68 on CFI.

The sequence of issuing RDSFDP instruction is same as FREAD: CS# goes low→ send RDSFDP instruction (5Ah)→send 3 address bytes on SI pin→ send 1 dummy byte on SI pin→ read SFDP code on SO→ to end RDSFDP operation can use CS# to high at any time during data out.

Detail SFDP data please contact Puya.

Figure 9-71a Read Serial Flash Discoverable Parameter (RDSFDP) Sequence (QPI)

Puya Semiconductor Page 105 of 116

9.72 Write Root Key Register (9Bh + 00h)

The Write Root Key Register instruction is used to program the RPMC root key. The PY25R256HB supports 4 monotonic counters, and each counter has a corresponding root key. Note that the Root Key Register is OTP (One-Time-Programmable).

TruncatedSign[223:0]=HMAC(RootKey[255:0], (9Bh, 00h, CounterAddr[7:0], Reserved[7:0]))

If RootKey[255:0] value is 256'hFF..FFh, RootKey is used as a temporary key, and if the monotonic counter has not been initialized, the corresponding monotonic counter value will be set to 0.

The instruction execution result is reflected to MC Status which can be read with the Read Monotonic Counter Status/Data (96h) instruction.

Puya Semiconductor Page 106 of 116

9.73 Update HMAC Key Register (9Bh + 01h)

The Update HMAC Key Register is used to update HMAC Key value. As with the RootKey, there are 4 HMAC Key registers too. Since the HMAC key register is volatile, the HMAC key should be updated after a power cycle.

HMAC Key[CounterAddr][255:0] = HMAC(RootKey[CounterAddr][255:0], KeyData[31:0])

Signature[255:0] = HMAC(HMAC Key[CounterAddr][255:0], (9Bh, 01h, CounterAddr[7:0].Reserved[7:0], KeyData[31:0]))

The instruction execution result is reflected to MC Status, which can be read with the Read Monotonic Counter Status/Data (96h) instruction.

Puya Semiconductor Page 107 of 116

9.74 Increment Monotonic Counter (9Bh + 02h)

The Increment Monotonic Counter instruction is used to increment the monotonic counter by 1.

Signature[255:0]=HMAC(HMAC Key[CounterAddr][255:0], (9Bh, 02h, CounterAddr[7:0]. Reserved[7:0], CounterData[31:0]*))

*CounterData[31:0] is current counter value read from PY25R256HB.

The instruction execution result is reflected to MC Status which can be read with the Read Monotonic Counter Status/Data (96h) instruction.

Puya Semiconductor Page 108 of 116

9.75 Request Monotonic Counter (9Bh + 03h)

The Request Monotonic Counter instruction is used to read current counter value from the PY25R256HB.

Signature[255:0]=HMAC(HMAC Key[CounterAddr][255:0], (9Bh, 03h, CounterAddr[7:0]. Reserved[7:0], Tag[95:0]))

The instruction execution result is reflected to MC Status which can be read with the Read Monotonic Counter Status/Data (96h) instruction.

After MC Status[0] BUSY=0, another Read Monotonic Counter Status/Data instruction (96h) should be issued to read out Tag[95:0], Counter Data[31:0] and Signature[255:0].

Signature[255:0]=HMAC(HMAC Key[CounterAddr][255:0], (Tag[95:0], Counter Data[31:0]))

9.76 Reserved Commands (9Bh + 04h~FFh)

The Reserved Commands should not be used.

The instruction execution result is reflected to MC Status which can be read with the Read Monotonic Counter Status/Data (96h) instruction.

Puya Semiconductor Page 109 of 116

9.77 Read Monotonic Counter Status/Data (96h)

The Read Monotonic Counter Status/Data instruction is used to read the previous OP1 command execution result status or counter data of RPMC.

The status, which is instruction dependent, is listed as below table.

Command Type	MC Status [7:0]	Description		
	1000 0000	Successful completion		
All OP1 common	0xxx xxx1	Busy		
	0xxx x1xx	Reserved command is issued		
WRK (9Bh+00h)	0xxx xx1x	Root Key Register overwrite; Counter Address is out of range; Truncated signature mismatch.		
	0xxx x1xx	Incorrect payload size		
	0xxx xx1x	Monotonic Counter is uninitialized		
UHK (9Bh+01h)	0xxx x1xx	Signature mismatch; Counter Address is out of range; Incorrect payload size		
	0xxx x1xx	Signature mismatch; Counter Address is out of range; Incorrect payload size		
INC_MC (9Bh+02h)	0xxx 1xxx	HMAC Key Register is uninitialized; Monotonic Counter is uninitialized		
	0xx1 xxxx	Counter Data[31:0] mismatch		
Req_MC (9Bh+03h)	0xxx x1xx	 Signature mismatch; Counter Address is out of range; Incorrect payload size 		
	0xxx 1xxx	HMAC Key Register is uninitialized; Monotonic Counter is uninitialized		
	0000 0000	Power on state		
Independent status	0x1x xxxx	Fatal Error		
macpendent status	last value	MC status[7:0] will not be updated until 9Bh instructions is received, will stay as last value.		

When previous OP1 command is Request Monotonic counters (9Bh + 03h), if SPI Flash returns successful completion (0x80) in the MC Status, then it must also return valid values in the Tag, Counter data and Signature field. If returns error flags, the values returned in Tag, Counter data and Signature field are invalid, the controller should ignore the data.

When MC Status[0] BUSY=1, the device will continuously output the MC status[7:0] until /CS terminates the instruction. It will not output Tag, Counter data and Signature field. Once MC Status[0] BUSY=0, another OP2 command should be issued to read out the status, Tag, Counter data and Signature field.

10 Ordering Information

PY 25 R 256H B - SM H - I T

Company Designator

PY = Puya Semiconductor

Product Family

25 = SPI interface flash

Product Serial

R = R serial with RPMC, QE=1 can not be changed

Memory Density

256 =256M bit

Operation Voltage

 $H = 2.7V^{3.6V}$

Generation

B = GE

Package Type

SM = SOP16 300mil WZ = WSON8 8x6x0.75mm

WX = WSON8 6x5x0.75mm

Plating Technology

H: RoHS Compliant, Halogen-free, Antimony-free

Device Grade

 $I = -40 \sim 85C$

Packing Type

T = TUBE

R = TAPE & REEL

Y = TRAY

11 Valid Part Numbers and Top Marking

The following table provides the valid part numbers for the PY25R256HB Flash Memory. Please contact PUYA for specific availability by density and package type. PUYA Flash memories use a 17-digit Product Number for ordering.

Package Type	Product Number	Density	Top Side Marking	Temp.	Packing Type
SM SOP16 300mil	PY25R256HB-SMH-IT	256M-bit	PY25R256HB xxxxxxx	85C	Tube
SM SOP16 300mil	PY25R256HB-SMH-IR	256M-bit	PY25R256HB xxxxxxx	85C	Reel
WZ WSON8 8x6mm	PY25R256HB-WZH-IR	256M-bit	PY25R256HB xxxxxxx	85C	Reel
WX WSON8 6x5mm	PY25R256HB-WXH-IR	256M-bit	PY25R256HB xxxxxxx	85C	Reel

Note: The package marked with "*", if necessary, please contact Puya sales.
