32-bit ARM[®] Cortex[®]-M0+ Microcontroller

Puya Semiconductor (Shanghai) Co., Ltd.

Features

- Core
 - 32-bit ARM® Cortex®-M0+
 - Frequency up to 72 MHz
- Memories
 - 256/ 192/ 128 / 64 KB Flash memory
 - 32 / 24 / 16 / 8 KB SRAM
- Clock management
 - 8/16/24/48/64 MHz High-speed internal RC oscillator (HSI)
 - 2 MHz Medium-speed internal RC oscillator (MSI)
 - 32.768 kHz Low-speed internal RC oscillator (LSI)
 - 4 to 32 MHz High-speed external crystal oscillator (HSE)
 - 32.768 kHz Low-speed external crystal oscillator (LSE)
 - PLL (supports 2-18 multiplication of HSI or HSE)
- Power management and reset
 - Operating voltage: 1.7 - 5.5 V
 - Low power modes: Low-power Run, Sleep, Low-power Sleep, Stop and Standby
 - Power-on/power-down reset (POR/PDR)
 - Programmable voltage detector (PVD)
- Input/output (I/O)
 - Up to 62 I/Os, all available as external interrupts
 - All IOs support 50 mA sink current (5 V tolerant)
 - 8 LED COM pins with configurable ultra-strong sink current: 120/100/80/60 mA
- Touch key
 - 16 GPIOs as LED SEG with constant-current drive
 - High-sensitivity design enables non-contact touch sensing
 - 10 V dynamic CS test-passed anti-interference mode
 - 33 touch channels with derived functions
- 7-channel DMA controller
- 1 x 12-bit ADC
 - Up to 25 external input channels
 - Voltage reference options: V_{CC} , embedded 0.6V/1.024V/1.5V/2.048V/2.5V
 - Input range: 0 - V_{REFP}
- 1 x 12-bit DAC (with 1 channel)
- 2 comparators
- 1 operational amplifier
- Support 8 * 36 / 4 * 40 LCD
- 14 timers
 - 1 x 16-bit advanced-control timer (TIM1)
 - 1 x 32-bit general-purpose timer (TIM2)
 - 4 x 16-bit general-purpose timers
 - 1 x PWM dedicated timer
 - 2 x basic timers (TIM6/TIM7)
 - 2 x low power timer (LPTIM)
 - 1 x independent watchdog timer (IWDG)
 - 1 x window watchdog timer (WWDG)
 - 1 x SysTick timer
- RTC
 - Support perpetual calendar

■ Communication interfaces

- 2 x serial peripheral interfaces (SPIs) with I²S function
- 2 x universal synchronous/asynchronous receiver/transmitters (USARTs), support automatic baud rate detection, ISO7816, LIN and IrDA
- 2 x universal asynchronous receiver transmitters (UARTs)
- 2 x low power universal asynchronous receiver/transmitters (LPUARTs)

- 2 x I²C interfaces support Standard mode (100 kHz), Fast mode (400 kHz) and Fast mode plus (1 MHz) 7-bit/10-bit addressing, SMBus/PMBus compatible

■ Hardware CRC-32 module**■ Unique UID****■ Serial wire debug (SWD)****■ Operating temperature: - 40 - 105 °C****■ Packages: LQFP64, LQFP48, LQFP44, LQFP32 and SOP28**

1. Introduction

The PY32T090 series incorporate a 32-bit ARM® Cortex®-M0+ core and operates at up to 72 MHz with a wide voltage range (1.7-5.5 V). It integrates up to 256 KB Flash and 32 KB SRAM, available in multiple package options. The device integrates multi-channel I²C, SPI, USART, LPUART and other communication peripherals. It has one 12-bit ADC, one DAC, 14 timers, two comparators, one operational amplifier, and one LCD driver.

The PY32T090 microcontrollers operate across a temperature range of -40 to 105°C and a standard voltage range of 1.7- 5.5 V, provides Low-power Run, Sleep, Low-power Sleep, Stop0/1/2/3 and Standby low-power operating modes, which can meet different low-power applications.

The PY32T090 series feature excellent touch and control characteristics. Coupled with its outstanding anti-interference performance, it can be adapted to touch buttons and main control in various solutions. Its applications span smart appliances, IoT, wireless communication, gaming devices, industrial controls, and consumer electronics.

2. Functional overview

2.1. Arm®-Cortex®-M0+ core

The Arm® Cortex® -M0+ is an entry-level Arm 32-bit Cortex processor designed for embedded systems. It provides developers with significant benefits, including:

- Simple architecture for easy learning and programming
- Ultra-low power consumption for energy-efficient operation
- Reduced code density

The Arm® Cortex-M0+ processor is a 32-bit core optimized for area and power consumption and is a 2-stage pipeline Von Neumann architecture. It delivers high performance through a streamlined instruction set and hardware enhancements like a single-cycle multiplier. Outperforms 8/16-bit MCUs in code efficiency.

The Cortex-M0+ is tightly coupled with a nested vectored interrupt controller (NVIC).

2.2. Memories

Embedded SRAM is accessed by byte (8 bits), half-word (16 bits) or word (32 bits) and supports write protection and byte parity check.

Embedded Flash, including 8-Bit-Flash ECC, contains two different physical areas:

- Main flash area supports dual-bank structure for application/user data
- 8 KB of Information area:
 - User data
 - Parameter bytes
 - Option bytes
 - UID bytes
 - System memory

The protection of Main flash area includes the following mechanisms:

- Read protection (RDP) blocks external access
- Write protection (WRP) prevents unintended writes (caused by confusion of program). The minimum protection unit for write protection is 8 KB.
- Option byte write protection is a special design for unlock.
- proprietary code read out protection (PCROP)

The integrated error correction code (ECC) in Flash supports:

- 1-bit error detection and correction
- 2-bit errors detection

2.3. Boot modes

At startup, the BOOT0 pin and boot selector option bit nBOOT are used to select one of the four boot options in the following table:

Table 2-1 Boot mode configuration

BOOT_LOCK	Boot modes		Mode
	nBOOT1 bit	BOOT0 pin	
1	X	X	Forced Boot from Main flash
0	X	0	Boot from Main flash
0	1	1	Boot from System memory
0	0	1	Boot from SRAM

The Boot loader is located in the System memory and is used to reprogram the Flash memory by using USART.

2.4. Clock management

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. After the program is operating the system clock frequency and system clock source can be reconfigured. The frequency clocks that can be selected are:

- An 8/16/24/48/64 MHz internal high-precision configurable HSI clock
- A 2 MHz internal high-precision MSI clock
- A 32.768 kHz configurable LSI clock
- A 4 to 32 MHz HSE clock, and used to enable the CSS function to detect HSE. If CSS fails, the hardware will automatically convert the system clock to HSI, and software configures the HSI frequency. Simultaneously, CPU NMI interrupt is generated.
- A 32.768 kHz LSE clock, and used to enable the CSS function to detect LSE. If CSS fails, the hardware will automatically convert the system clock to LSI, and software configures the LSI frequency. Simultaneously, CPU NMI interrupt is generated.
- PLL clock has HSE source. If the HSE source is selected, when CSS is enabled and CSS fails, the PLL and HSE will be turned off, and the hardware selects the system clock source as HSI.

The AHB clock can be divided based on the system clock, and the APB clock can be divided based on the AHB clock. The maximum frequency of the AHB and the APB domains is 72 MHz.

2.5. Power management

2.5.1. Power block diagram

Figure 2-2 Power block diagram

Table 2-2 Power block diagram

No.	Power supply	Value	Descriptions
1	V _{CC}	1.7 - 5.5 V	The power is supplied to the device through the power pins, with the power supply module comprising: Partial analog circuits
2	V _{CCA}	1.7 - 5.5 V	Powers for most analog modules, sourced from the V _{CC} PAD (a dedicated power PAD can also be designed separately).
3	V _{REFP}	1.7 - 5.5 V	Reference voltage for ADC and DAC
4	V _{DD}	1.2 V	VR supplies power to the main logic circuits (CPU, bus, RCC, PWR and peripheral IPs) and SRAM inside the device. When the MR is powered, it outputs 1.2 V. According to the software configuration, when entering the Stop or Standby mode it powered by MR, LPR and DLPR.

2.5.2. Power monitoring

2.5.2.1. Power on reset (POR/PDR)

The Power-on reset (POR) and Power-down reset (PDR) module is designed to provide power-on and power-off reset for the device. The module keeps working in all modes.

2.5.2.2. Programmable voltage detector (PVD)

Programmable voltage detector (PVD) module can be used to detect the V_{CC} power supply and the detection point is configured through the register. When V_{CC} is higher or lower than the detection point of PVD, the corresponding reset flag is generated.

This event is internally connected to line 16 of EXTI, depending on the rising/falling edge configuration of EXTI line 16, when V_{CC} rises above the detection point of PVD, or V_{CC} falls below the detection point of PVD, an interrupt is generated. In the service program, users can perform urgent shutdown tasks.

Figure 2-3 PVD threshold

2.5.3. Voltage regulator

The regulator has three operating modes:

- Main regulator (MR) is used in normal operating mode (Run).
- Low power regulator (LPR) provides an option for even lower power consumption in low power mode.
- Deep low power regulator (DLPR) ensures the lowest power consumption in low power mode.

2.5.4. Low-power mode

In addition to the normal operating mode, there are five low-power modes:

- Sleep mode: Peripherals can be configured to keep working when the CPU clock is off (NVIC, SysTick, etc.). It is recommended only to enable the modules that must work, and close the module after the module works.
- Low-power run mode: The Max. CPU frequency is 2 MHz and the voltage regulator operates in low-power mode to save energy.
- Low-power sleep mode: entered only from Low-power run mode and CPU core clock is turned off. The system returns to Low-power run mode when awakened by an event or interrupt.

- Stop0/Stop1/Stop2/Stop3 modes: SRAM and register contents are retained. Clocks (PLL, HSI, MSI, HSE) and most module clocks in the V_{DD} domain are disabled. Specific modules can be configured to power down. Wake-up sources: GPIO, PVD, COMP, LPUART, I2C, IWDG, TK, RTC, TAMP and LPTIM.
- Standby mode: partial digital logic and SRAM in the V_{DD} domain are powered off. Exit conditions: External reset via NRST, IWDG reset, RTC alarm wakeup, and valid edge on the WKUP pin.

2.6. Reset

Two resets are designed in the device: power reset and system reset.

2.6.1. Power reset

A power reset occurs in the following situations:

- Power-on/power-down reset (POR/PDR)

2.6.2. System reset

A system reset occurs when the following events occur:

- Reset of NRST pin
- Windowed watchdog reset (WWDG)
- Independent watchdog reset (IWDG)
- SYSRESETREQ software reset
- Option byte load reset (OBL)

2.7. General-purpose inputs/outputs (GPIOs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (floating, pull-up or pull-down and analog) or as peripheral alternate function. The I/O configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers. GPIO features are summarized as follows:

- Support read/write operations via IO Port or AHB bus
- Output states: push-pull or open drain + pull-up/down
- Output data from output data register (GPIOx_ODR) or peripheral (alternate function output)
- Speed selection for each I/O
- Input states: floating, pull-up/down, and analog
- Input data to input data register (GPIOx_IDR) or peripheral (alternate function input)
- Bit set and reset register (GPIOx_BSRR) for bitwise write access to GPIOx_ODR
- Locking mechanism (GPIOx_LCKR) provided to freeze the I/O port configurations
- Analog function
- Alternate function selection registers (Max. 16 alternate functions for each IO)
- Fast toggle capable of changing every clock cycles

- Highly flexible pin multiplexing allows the use of I/O pins as GPIOs or as one of several peripheral functions

2.8. Direct memory access controller (DMA)

Direct memory access (DMA) is used to provide a high-speed data transfer between peripherals and memory as well as from memory to memory. Data can be quickly moved by DMA without any CPU actions. This keeps the CPU resources free for other operations. The DMA controller have 7 channels in total, each one dedicated to manage memory access requests from one or more peripherals. Each controller has an arbiter for handling the priority between DMA requests.

The DMA supports:

- 7 configurable channels
- Each channel is associated either with a DMA request signal coming from a peripheral, or with a software trigger in memory-to-memory transfers. This configuration is done by software.
- Priority between multiple requests on the same DMA module is software-programmable. For equal priorities, hardware resolves conflicts (lower channel number = higher priority).
- The transfer sizes of the source and destination are independent (byte, half word and word), simulating packing and unpacking. Source and destination addresses must be aligned to the transfer width.
- Programmable address modes: Increment, decrement, or fixed
- Each channel has 4 event flags: transfer complete (circular mode), block transfer, half-block transfer and transfer error. They are logically ORed to generate a single interrupt request.
- Support transfers between memory to memory, peripheral to memory, memory to peripheral and peripheral to peripheral
- SRAM, APB and AHB peripherals can act as source or destination. Flash can only act as a source.
- Support single-trigger mode and four circular modes:
 - Peripheral address retained, memory address retained
 - Peripheral address reloaded, memory address retained
 - Peripheral address retained, memory address reloaded
 - Both addresses reloaded
- Single-trigger mode: Programmable transfer count (0 - 65,535)
- Circular mode: Infinite looping or finite looping (1 - 255 cycles)
- Support single transfer and bulk transfer
 - Single transfer: Generates 1 ACK per data transfer
 - Bulk transfer: Generates 1 ACK after all configured data is transferred (bus released post-completion).
- Two transfer modes
 - Fast mode: Holds the bus until all data is transferred

- Round-robin mode: Releases the bus after each transfer for re-arbitration
- Support pausing transfers upon entering the block transfer Complete interrupt in circular mode.

2.9. Interrupts and events

The PY32T090 handles exceptions through the Cortex-M0+ processor's embedded a nested vectored interrupt controller (NVIC) and an extended interrupt/event controller (EXTI).

2.9.1. Nested vectored interrupt controller (NVIC)

NVIC is a tightly coupled IP inside the Cortex-M0+ processor. The NVIC can handle non-maskable interrupts (NMI) and maskable external interrupts from outside the processor and Cortex-M0+ internal exceptions. NVIC provides flexible priority management.

The tight coupling of the processor core to the NVIC greatly reduces the delay between an interrupt event and the initiation of the corresponding interrupt service routine (ISR). The ISR vectors are listed in a vector table, stored at a base address of the NVIC. The vector table base address determines the vector address of the ISR to execute, and the ISR is used as the offset composed of serial numbers.

If a higher-priority interrupt event occurs and a lower-priority interrupt event is just waiting to be serviced, the later-arriving higher-priority interrupt event will be serviced first. Another optimization is called tail-chaining. When returning from a higher-priority ISR and then starting a pending lower-priority ISR, unnecessary pushes and pops of processor contexts will be skipped. This reduces latency and improves power efficiency.

NVIC features:

- Low latency interrupt handling
- Level 4 interrupt priority
- Support 1 NMI
- Support 32 maskable external interrupts
- High-priority interrupts can interrupt low-priority interrupt responses
- Support tail-chaining optimization
- Hardware interrupt vector retrieval

2.9.2. Extended interrupt/event controller (EXTI)

EXTI adds flexibility to handle physical wire events and generates wake-up events by GPIO and modules (PVD, COMP, RTC, TAMP, I²C, LPUART, TK and LPTIM).

The EXTI controller has multiple channels, including a maximum of 16 GPIOs, one PVD output, two COMP outputs, two LPUART signals, two I²C, two LPTIM wake-up signals, TK, RTC, TAMP and LSE CSS signal. GPIO, PVD and COMP can be configured to be triggered by a rising edge, falling edge or double edge. Any GPIO signal can be configured as EXTI0 to 15 channel through the select signal.

- Each EXTI line can be independently masked through registers.
- The EXTI controller can capture pulses shorter than the internal clock period.

- Registers in the EXTI controller latch each event. Even in Stop mode, after the processor wakes up from Stop mode, it can identify the wake-up source or identify the GPIO and event that caused the interrupt.

2.10. Analog-to-digital converter (ADC)

The PY32T090 has a 12-bit SARADC. The module has a total of up to 30 channels to be measured, including 25 external and 5 internal channels, including 3 pairs of differential channels.

The internal channels are: T_{S_VIN} , V_{REFINT} , $V_{CC}/3$, OPA and DAC.

- A/D conversion of the various channels can be performed in single, continuous, or discontinuous mode. The result of the ADC is stored in a left-aligned or right-aligned 16-bit data register.
- The analog watchdog feature allows the application to detect if the input voltage goes outside the user-defined higher or lower thresholds.
- Interrupt generation at ADC ready, the end of sampling, the end of conversion, end of sequence conversion, analog watchdog or overrun events
- The ADC is configurable with 12/10/8/6-bit resolutions.
- Maximum ADC sampling rate: 2 MSPS
- Support self-calibration (initiated by software)
- Support programmable sampling time
- The data register allows configurable data alignment
- Support DMA requests for regular channel data conversion
- Support configurable conversion of 16 regular channels
- Support configurable conversion of 4 injected sequences
- The oversampler is equipped with a 16-bit data register. The oversampling rate can be adjusted from 2 to 256, and the programmable data shift can reach up to 8 bits.
- Data processing supports gain compensation and offset compensation.

2.11. Digital-to-analog converter (DAC)

The two 12-bit buffered DAC channels can be used to convert digital signals into analog voltage signal outputs. The DAC can be configured in 8-bit or 12-bit mode, or can be used in conjunction with a DMA controller. When the DAC is operating in 12-bit mode, the data can be left justified or right justified.

The DAC module has one output channel. The main features are as follows:

- Left or right data alignment in 12-bit mode
- Synchronized update capability
- Noise-wave generation
- Triangular-wave generation
- DMA support for each channel
- Support DMA underflow error detection

- External triggers for conversion
- Input reference voltages: V_{CCA} , V_{REFP} , and V_{REFBUF}
 - The V_{REFBUF} of the DAC only supports 2.5 V

2.12. Comparators (COMP)

The PY32T090 integrates two general-purpose comparators (COMP), namely COMP1 and COMP2. The COMP1/2 module can be used as a separate module or in combination with timer.

The COMP features:

- Triggered by analog signal to wake-up function from low-power mode
- Analog signal conditioning
- Cycle by cycle current control loop when comparators are connected with PWM output from timer
- Voltage comparison function is supported. Each comparator has configurable positive or negative input for flexible voltage selection:
 - Multiple I/O pins
 - 64 steps voltage of V_{CCA}/V_{REFBUF}
 - Temperature sensor output
 - DAC output
 - OPA output
 - V_{REFINT}
- Programmable speed and power consumption
- Programmable hysteresis function
- Write protection for configuration registers (LOCK function)
- The output can be triggered by a connection to the I/O or timer input
- Each COMP has interrupt generation capability and is used to wake up the device from low power mode (Sleep/Stop) (via EXTI)
- Provide software to configure the digital filtering time to enhance the anti-interference capability of the device
- Support output blanking to reduce switching noise
- Support the window comp function

2.13. Operational amplifier (OPA)

The OPA module can be flexibly configured and is suitable for simple amplifiers.

OPA features are summarized as follows:

- One independently configured operational amplifier
- The inputs can be individually configured to select from two channels, and the outputs can be configured to select from four IO channels. The outputs can be internally directed to the comparator and ADC.

- The input range of the OPA is from 0 to V_{CCA} , and the output range is from 0.1 V to $V_{CCA} - 0.2$ V.
- Can be configured for the following models
 - General purpose OPA

2.14. Liquid crystal display controller (LCD)

The liquid crystal display (LCD) controller is a digital controller/driver for monochrome passive LCD, with up to 8 common terminals (COM) and 40 segment terminals (SEG) to drive 160 (4 * 40) or 288 (8 * 36) LCD pixels. The exact number of terminals depends on the device pins described in the data manual. LCD functions are summarized as follows:

- Highly flexible frame rate control
- Support static, 1/2, 1/3, 1/4, 1/6, and 1/8 of a duty ratio
- Support static, 1/2, 1/3 and 1/4 bias voltage
- Supported display modes: Type A or Type B
- Three ways to generate driving waveforms: internal resistor voltage division, external resistor voltage division, and external capacitor voltage division
 - With internal resistor voltage division, power consumption can be reduced by using software to configure the conduction time of the internal high-drive voltage-dividing resistors, thus matching the capacitance charge required by the LCD panel. The contrast of the LCD can also be configured via software to adjust the brightness of the LCD panel
 - For external resistor voltage division, the capacitance charge required by the LCD panel can be matched by adjusting the resistance value of the external resistors
 - In the case of external capacitor voltage division, the capacitance charge required by the LCD panel can be matched by using software to configure the number of capacitor driving times
- Support LCD flashing function and configuration of multiple flicker frequency configuration
- Support the configurable LCD dead time function to adjust the display brightness
- Unused LCD segments and public pin can be configured to digital or analog functions
- Up to 16 registers LCD data RAM
- Dual buffer memory allows the data in the LCD_RAM registers to be updated at any time through the application firmware without affecting the integrity of the displayed data
- Support low power modes: The LCD controller can perform display operations in Run, Low-power Run, Sleep, Low-power Sleep, and Stop modes
- Configurable frame interrupt

2.15. Touch key

The PY32T090 integrates a 33 channel capacitive touch circuit:

- Optional internal/external CMOD capacitor, no external capacitor needed for internal use

- High-sensitivity for non-contact touch
- 10 V dynamic CS test-passed anti-interference mode
- Support the frequency hopping function
- Support the waterproof compensation function
- Support multi-channel parallel connection
- Low-power mode: <10 μ A for ≤ 16 channels in touch low-power mode.

2.16. Timers

The different timers feature as blow:

Table 2-3 Timer characteristics

Timer type	Timers	Counter resolution	Counter type	Prescaler	DMA	Capture/compare channels	Complementary outputs
Advance control	TIM1	16-bit	Up, down up/down	1 - 65536	Yes	4	3
General purpose	TIM2	32-bit	Up, down up/down	1 - 65536	Yes	4	-
	TIM3	16-bit	Up, down up/down	1 - 65536	Yes	4	-
	TIM15	16-bit	Up	1 - 65536	Yes	2	1
	TIM16, TIM17	16-bit	Up	1 - 65536	Yes	1	1
Basic	TIM6	32-bit	Up	1 - 65536	Yes	-	-
	TIM7	16-bit	Up	1 - 65536	Yes	-	-
Dedicated timers	PWM	16-bit	Up, down up/down	1 - 65536	Yes	4	2

2.16.1. Advanced-control timer (TIM1)

The advanced-control timer (TIM1) is consist of a 16-bit auto-reload counter driven by a programmable prescaler. It can be used in various scenarios, including pulse length measurement of input signals (input capture) or generating output waveforms (output compare, output PWM, complementary PWM with dead-time insertion).

The four independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned mode)
- Single pulse mode output
- Support incremental (quadrature) encoders and Hall sensor circuits for positioning.

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0 - 100%).

The counter can be frozen in debug mode.

Many features are shared with those of the standard timers which have the same architecture. The advanced control timer can therefore work together with the other timers by the Timer Link feature for synchronization or event chaining.

TIM1 supports the DMA function.

2.16.2. General-purpose timers

2.16.2.1. TIM2/TIM3

The general-purpose timers TIM2/TIM3 are consist of 32/16-bit auto-reload counters and a 32/16-bit prescaler. There are four independent channels each for input capture/output compare, PWM or one-pulse mode output.

- They can work with the TIM1 by the timer link.
- Support DMA function
- The counter can be frozen in debug mode.

2.16.2.2. TIM15/TIM16/TIM17

- The general-purpose timer (TIM15, TIM16 and TIM17) is consist of a 16-bit auto-reload counter driven by a programmable prescaler.
- TIM15 features two single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM16/TIM17 features one single channel for input capture/output compare, PWM or one-pulse mode output.
- TIM15/TIM16/TIM17 have complementary outputs with dead time.
- TIM15/TIM16/TIM17 support DMA function.
- The counter can be frozen in debug mode.

2.16.3. Basic timers (TIM6/TIM7)

- The basic timer TIM6 is consist of a 32-bit auto-reload upcounter driven by their programmable prescaler respectively.
- The basic timer TIM7 is consist of a 16-bit auto-reload upcounter driven by their programmable prescaler respectively.
- 16-bit / 32-bit auto-reload upcounter
- Generate interrupt/DMA request on update event (counter overflow).

2.16.4. PWM dedicated timer

This module can generate a pulse width modulation (PWM) signal with a frequency and duty cycle determined by registers. Support external clock counting, and the frequency can exceed the PCLK frequency.

- A 16-bit up, down, or up/down auto-reload counter
- A programmable prescaler that allows the clock frequency of the counter to be divided from 1 to 65,536
- Support write protection for important registers
- Up to 4 independent channels

- Support complementary outputs with programmable dead time for 2 channels.
- Support 1 brake input
- Support DMA function

2.16.5. Low power timer (LPTIM)

LPTIM1/LPTIM2 are 32-bit/16-bit timers. The ability of LPTIM to wake the system from low-power modes makes it suitable for practical low-power applications. LPTIM introduces a flexible clock scheme that can provide the required functionality and performance while minimizing power consumption.

- LPTIM1 is a 32-bit and LPTIM2 is a 16-bit up-counter
- It has a 3-bit prescaler with 8 possible division factors (1, 2, 4, 8, 16, 32, 64, 128)
- Optional clocks include LSE, LSI, APB clock, or an external clock source
- Support single-shot and continuous modes
- Support software/hardware input triggering
- The counter can be frozen in debug mode.

2.16.6. Independent watchdog (IWDG)

Independent watchdog (IWDG) is integrated in the device, and this module has the characteristics of high-security level, accurate timing and flexible use. IWDG finds and resolves functional confusion due to software failure and triggers a system reset when the counter reaches the specified timeout value.

- The IWDG is clocked by LSI or LSE and can work in Stop and Standby mode.
- IWDG is the best suited for applications that require the watchdog as a standalone process outside of the main application and do not have high timing accuracy constraints.
- Controlling of option byte can enable IWDG hardware mode.
- IWDG is the wake-up source of Stop mode, which wakes up Stop mode and Standby mode by reset.
- The counter can be frozen in debug mode.

2.16.7. System window watchdog (WWDG)

The system window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock (PCLK). It has an early warning interrupt capability, and the counter can be frozen in debug mode.

2.16.8. SysTick timer

SysTick timer is dedicated to real-time operating systems (RTOS), but could also be used as a standard down counter.

SysTick features:

- A 24-bit down counter
- Auto-reload capability
- Maskable system interrupt generation when the counter reaches 0

2.17. Real-time clock (RTC)

The real-time clock (RTC) is an independent timer that provides an automatic wake-up unit for managing all low-power modes. It is an independent binary-coded decimal (BCD) timer/counter, offering a calendar clock/calendar with programmable alarm interrupt functionality. As long as the power supply voltage remains within the operating range, the RTC will continue to operate regardless of the device's state (run mode, low-power mode, or in reset).

The calendar includes subseconds, seconds, minutes, hours (12 or 24 format), day week day, date, month and year, presented in BCD format

- Automatic correction for 28, 29 (leap year), 30, and 31 day of the month
- Two programmable alarms
- Allow in runtime correction of 1 to 32,767 RTC clock pulses for synchronization with the main clock.
- Supports reference clock detection: enable the use of a more accurate secondary clock source (50 or 60 Hz) to enhance calendar accuracy
- Equipped with a digital calibration circuit having a resolution of 0.95 ppm to compensate for quartz crystal oscillator errors.
- The timestamp feature can save calendar content, which can be triggered by events on the timestamp pin and tamper events.
- Comes with a 17-bit auto-reload wake-up timer (WUT) for periodic events, with programmable resolution and period.
- The following three RTC clock sources can be selected:
 - HSE clock divided by 32
 - LSE clock
 - LSI clock
- Three dedicated maskable interrupts:
 - Alarm interrupt
 - Timestamp interrupt
 - Wake-up timer interrupt

2.18. Cyclic redundancy check calculation unit (CRC)

CRC computing unit is based on a fixed generation polynomial to obtain CRC computing results. In other applications, CRC technology is mainly used to verify the correctness and integrity of data transmission or data storage. The CRC calculation unit contains a 32-bit data register:

- When writing to this register, it serves as an input register, allowing you to input new data for CRC calculation
- When reading from this register, it returns the result of the previous CRC calculation

- Each time data is written to the register, the calculation result is a combination of the previous CRC calculation result and the new one (CRC calculation is performed on the entire 32-bit word rather than byte by byte)
- You can reset the register CRC_DR to 0xFFFFFFFF by setting the RESET bit in the register CRC_CR. This operation does not affect the data in the register CRC_IDR
- Support configuration of the initial CRC value
- Support configuration of the CRC polynomial
- Support inverting the input data in units of 8/16/32 bits
- Support output inversion
- The input data bit width supports 8/16/32 bits.
- The polynomial bit width can be configured as 7/8/16/32 bits, which is equivalent to the bit width of the output data

2.19. System configuration controller (SYSCFG)

The SYSCFG module provides the following functions:

- Enable and disable I²C type IO filter
- Enable and disable I²C Fast mode plus
- Mapping the initial program area according to different boot modes
- DMA peripheral channel selection control
- Analog input channel enable
- Analog PAD2 enable

Enable and disable Noise filter for all GPIOs

- Enable and disable PVD Lock
- Enable and disable Cortex-M0+ LOCKUP
- Enable and disable ECC Lock
- Enable and disable SRAM parity check
- LED IO control

2.20. Debug support (DBG)

The MCU DBG module assists the debugger with the following functions:

- Support Sleep, Stop and Standby mode
- When the CPU enters the HALT mode, the control timer or watchdog stops counting or continues counting
- Block I²C1 and I²C2 SMBUS timeouts when the CPU is in HALT mode

The MCUIDBG register also provides device ID encoding. This ID encoding can be accessed by a JTAG or SW debug interface, or by a user program.

2.21. Inter-integrated circuit interface (I²C)

The I²C bus interface handles communications between the microcontroller and the serial I²C bus. It provides multimaster capability, and controls all I²C bus-specific sequencing, protocol, arbitration and timing. It supports Standard-mode (Sm), Fast-mode (Fm) and Fast-mode plus (Fm+).

I²C features:

- Two I²C interface
- Multimaster capability: can be master or slave
- Support different communication speeds
 - Standard mode (Sm): up to 100 kHz
 - Fast mode (Fm): up to 400 kHz
 - Fast mode plus (Fm+): up to 1 MHz
- As Master
 - Generate clock
 - Generate Start and Stop
- As Slave
 - Programmable I²C address detection
 - Dual-address capability that responds to two secondary addresses
 - Discovery of the Stop bit
- 7-bit/10-bit addressing mode
- General call
- Status flag
 - Transmit/receive mode flags
 - Byte transfer complete flag
 - I²C busy flag bit
- Error flag
 - Master arbitration loss
 - ACK failure after address/data transfer
 - Start/stop error
 - Overrun/underrun (clock stretching function disable)
- Optional clock stretching
- Single-byte buffer with DMA capability
- Software reset
- Analog noise filter function
- Hardware packet error checking (PEC) generation and verification with ACK control
- Support SMBus

- Support low-power modes, wakes up from Stop mode on address matching.

2.22. Universal synchronous/asynchronous receiver transmitter (USART)

PY32T090 contains 2 USARTs and supports ISO7816, LIN and IrDA.

The USARTs provide a flexible method for full-duplex data exchange with external devices using the industry-standard NRZ asynchronous serial data format. The USART utilizes a fractional baud rate generator to provide a wide range of baud rate options.

It supports simultaneous one-way communication and half-duplex single-wire communication, and it also allows multi-processor communication.

High-speed data communication can be achieved by using the DMA method of the multi-buffer configuration.

USART features:

- Full-duplex asynchronous communication
- NRZ standard format
- Configurable 16 times or 8 times oversampling for increased flexibility in speed and clock tolerance
- Programmable baud rate shared by transmit and receive, up to 4.5 Mbit/s
- Automatic baud rate detection
- Programmable data length of 8 or 9 bits
- Configurable stop bits (0.5, 1, 1.5 or 2 bits)
- Synchronous mode and clock output function for synchronous communication
- Single-wire half-duplex communication
- Independent transmit and receive enable bits
- Hardware flow control
- Receive/transmit bytes by DMA buffer
- Transfer detection flag
 - Receive buffer full
 - Send empty buffer
 - End of transmission flags
- Parity control
 - Transmit parity bit
 - Check the received data byte
- Configurable Tx and Rx pin SWAP
- MSB First data transmission and reception format
- Support LIN master transmit sync break and slave detect break

- Generates 13-bit break and detects 10/11-bit breaks when configured for LIN
- IRDA SIR encoder/decoder
 - Support a 3/16-bit duration in normal mode
- Smart card emulation function
 - Smart card interface supports ISO7816-3 asynchronous protocol
 - 0.5 and 1.5 stop bits for the smart card
 - Configurable MSB or LSB transmission
 - The NACK signal width can be configured to 1/1.5/2 ETU
 - Support transmission error retransmit
 - Support an EGT setting from 0 to 256 and multiple timeout interrupts
- Flagged interrupt sources
 - CTS change
 - Transmit data register empty
 - Transmission complete
 - Receive data register full
 - Bus idle detected
 - Overflow error
 - Frame error
 - Noise operation
 - Error detection
- Multiprocessor communication
 - If the address does not match, enter silent mode
- Wake-up from silent mode: by idle detection and address flag detection

2.23. Universal asynchronous receivers/transmitter (UART)

The PY32T090 features two universal asynchronous receivers/transmitters (UARTs):

- Support 5/6/7/8/9-bit serial data
- Support 1/2 STOP bits (1/1.5 STOP bits for 5-bit data)
- Support sending address/data
- Support fixed parity check
- Support break frames
- Detect start bit errors
- Support programmable fractional baud rates
- Support Tx/Rx pin swapping
- Support MSB FIRST endianness switching

- Full-duplex asynchronous communication
- NRZ standard format
- Support DMA transmission
- Support 4-bit fractional baud

2.24. Low-power universal asynchronous receivers/transmitters (LPUART)

The PY32T090 integrates two LPUARTs, supporting wake-up from Sleep and Stop modes.

Features:

- Full-duplex asynchronous communication
- NRZ standard format
- Programmable baud rate
- 32.768 kHz clock with baud rate range 300-9600, higher rates need higher clock freq
- Dual clock domains: PCLK and dedicated kernel clock
- Programmable data word length (7/8/9 bits)
- Programmable data order with MSB-first or LSB-first shifting
- Configurable stop bits (1/2 Stop bits)
- Single-wire half-duplex communications
- Support continuous DMA transfer
- Independent enable for transmission and reception
- Independent polarity control for Tx/Rx signals
- Interchangeable Tx/Rx pins
- Support hardware RS-485/modem flow control
- Parity control: generates parity bit on transmission, checks on reception
- Four error detection flags:
 - Overrun error
 - Noise error
 - Frame error
 - Parity error
- Interrupt sources with flags:
 - CTS change
 - Transmit data register empty
 - Transmission complete
 - Receive data register full
 - Bus idle detected

- Overflow error
- Frame error
- Noise operation
- Error detection
- Match address byte
- Support 5/6/7/8/9-bit serial data
- Support wake-up from Stop, Sleep, Low-power Run, and Low-power Sleep modes

2.25. Serial peripheral interface (SPI)

The PY32T090 contains two SPI/I²S module.

SPIs allow the device to communicate with external devices in half-duplex, full-duplex, and simplex synchronous serial communication. This interface can be configured in Master mode and provides the serial clock (SCK) for external slave devices. The interface can also work in a multi-master configuration.

The SPI features are as follows:

- Master or Slave mode
- Full-duplex synchronous transfers on three lines
- Half-duplex synchronous transfer on two lines (with bidirectional data line)
- Simplex synchronous transfers on two lines (with unidirectional data line)
- 8-bit or 16-bit transmission frame selection
- Support multi-master mode
- 8 Master mode baud rate prescalers (Max $f_{PCLK}/2$)
- Slave mode frequency (Max $f_{PCLK}/2$)
- Both Master and Slave modes can be managed by software or hardware NSS: dynamic change of Master/Slave operating mode
- Programmable clock polarity and phase
- Programmable data order with MSB-first or LSB-first shifting
- Dedicated transmission and reception flags with interrupt capability
- SPI bus busy status flag
- Support Motorola mode and TI mode
- Master mode fault, overrun flags with interrupt capability
- CRC Error flag
- Two embedded Rx and Tx FIFOs with DMA capability, depth of four, and width of 16 bits (8 bits when data frame is set to 8 bits)

I²S features:

- Half-duplex communication (only transmitter or receiver)

- Master or slave operations
- 8-bit programmable linear prescaler to reach accurate audio sample frequencies (from 8 kHz to 96 kHz)
- Data format may be 16-bit, 24-bit or 32-bit
- Packet frame is fixed to 16-bit (16-bit data frame) or 32-bit (16-bit, 24-bit, 32-bit data frame) by audio channel
- Programmable clock polarity (steady state)
- Underrun flag in slave transmission mode, overrun flag in reception mode (master and slave) and frame error flag in reception and transmitter mode (slave only)
- 16-bit register for transmission and reception with one data register for both channel sides
- Support I²S protocols:
 - I²S Phillips standard
 - MSB-justified standard (left-justified)
 - LSB-justified standard (right-justified)
 - PCM standard (with short and long frame synchronization on 16-bit channel frame or 16-bit data frame extended to 32-bit channel frame)
- Data direction is always MSB first
- DMA capability for transmission and reception
- Master clock may be output to drive an external audio component. Ratio is fixed at $256 \times F_s$ (where F_s is the audio sampling frequency)

2.26. Serial wire debug (SWD)

An ARM SWD interface allows serial wire debugging tools to be connected to the PY32T090.

1. Configured by option bytes to choose PD13 or NRST.
2. After reset, when the option byte is configured to 0/0 (default state), PA5 and PA4 are configured as SWCLK and SWDIO.
3. PA4, PA5, PB6, and PB5 can be configured via options to select GPIO functionality or SWC/SWD functionality. Internal pull-up resistors for PA4 and PB6, and internal pull-down resistors for PA5 and PB5 are activated.

option[1:0]	PA5	PA4	PB6	PB5
0/0(default)	SWCLK	SWDIO	GPIO	GPIO
0/1	GPIO	GPIO	SWDIO	SWCLK
1/0	SWCLK	GPIO	SWDIO	GPIO
1/1	GPIO	SWDIO	GPIO	SWCLK

4. Pins configured for SWD/NRST functions cannot be used as TK channels.
5. PD8-BOOT0 defaults to digital input mode and pull-down is enabled.
6. PA6, PA7 and PA8 are powered via a current-limited switch (3 mA sourcing). GPIO from PC13 to PC15 output mode restrictions:

- a) Maximum rate 2 MHz, load ≤ 30 pF.
 - b) Cannot be used as current sources (e.g., LED driving).
- 7. V_{REFP} requires 1 μ F external capacitor when using V_{REFBUF} . ADC/DAC cannot use V_{REFBUF} as reference if PA0 is not routed.
 - 8. Two I/O ports are multiplexed on the same pin. Only one of the I/O ports can be used at any given time, while the other must be configured in analog mode (by setting $MODEy[1:0]$ to 0B11).

5. Electrical characteristics

5.1. Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS} .

5.1.1. Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25^\circ\text{C}$ and $T_A = T_{A(\text{max})}$ (given by the selected temperature range).

Data based on electrical characterization results, design simulations and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation.

5.1.2. Typical values

Unless otherwise specified, typical data is based on $T_A = 25^\circ\text{C}$ and $V_{CC} = 3.3\text{ V}$. These data are for design guidance only and have not been tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated.

5.2. Absolute maximum ratings

Stresses above the absolute maximum ratings listed in following tables may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 5-1 Voltage characteristics⁽¹⁾

Symbol	Ratings	Min	Max	Unit
$V_{CC} - V_{SS}^{(1)}$	External mains power supply	- 0.3	6.25	V
$V_{IN}^{(2)}$	Input voltage of other pins	- 0.3	$V_{CC} + 0.3$	V

1. Main power V_{CC} and ground V_{SS} pins must always be connected to the external power supply, in the permitted range.
2. Maximum V_{IN} must always follow allowable maximum injection current limits as per the table.

Table 5-2 Current characteristics

$\Sigma I_{IO(PIN)}^{(2)}$	Total output current sunk by sum of all I/Os and control pins	200	
	Total output current sourced by sum of all I/Os and control pins	180	
$I_{IO}^{(2)}$	Output current sunk by any COM I/O and control pin	60	

Symbol	Ratings	Max	Unit
	Output current sunk by any COM_L I/O and control pin	140	
	Output current source by any COM I/Os and control pin ⁽³⁾	25	

1. Main power V_{CC} and ground V_{SS} pins must always be connected to the external power supply, in the permitted range.
2. These I/O types refer to the terms and symbols defined by pins.
3. Excluding PA6/PA7/PA8, which are powered via a current-limited switch (3 mA sourcing).

1. Crystal/ceramic resonator characteristics are based on the manufacturer's datasheet.
2. Guaranteed by design, not tested in production.
3. t_{SU(HSE)} is the startup time from enable (by software) to when the clock oscillation reaches a stable state, measured for a standard crystal/resonator, which can vary considerably from one crystal/resonator to another.
4. Data based on characterization results, not tested in production.

5.3.6.4. Low-speed external clock generated from a crystal resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal resonator oscillator. In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time.

1. Guaranteed by design, not tested in production.
2. Data based on characterization results, not tested in production.
3. For some package types, V_{REFP} can be internally connected to V_{CCA} , and V_{REFN} can be internally connected to V_{SSA} . For details, please refer to the pin definitions.
4. When using external triggering, an additional delay of $1/f_{PCLK2}$ is required.
 - a) $R_{AIN} < \frac{T_S}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$
 - b) The formula above (Equation 1) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. $N = 12$ (referring to 12-bit resolution).

2. ADC DC accuracy values are measured after internal calibration.

3. ADC accuracy and reverse injection current: Reverse current injection on any standard analog input pin should be avoided, as it will significantly reduce the conversion accuracy of the ongoing conversion on another analog input pin. It is recommended to add a Schottky diode (between the pin and ground) to the standard analog input pins where reverse injection current may occur.

4. The parameter test conditions are: $1.7\text{ V} \leq V_{\text{CCA}} = V_{\text{REFP}} \leq 5.5\text{ V}$, $f_{\text{ADC}} = 8\text{ MHz}$, and 12-bit resolution.

5.3.24. Communication interfaces

5.3.24.1. I²C interface characteristics

I²C interface meets the requirements of the I²C bus specification and user manual:

- Standard-mode (Sm): 100 kHz
- Fast-mode (Fm): 400 kHz
- Fast-mode plus (Fm+): 1 MHz

I²C SDA and SCL pins have analog filtering, see table below.

Table 5-50 I²C filter characteristics

Symbol	Parameter	Min	Max	Unit
t _{AF}	Limiting duration of spikes suppressed by the filter (Spikers shorter than the limiting duration are suppressed)	50	260	ns

5.3.24.2. SPI characteristics

Table 5-51 SPI characteristics

Symbol	Parameter	Conditions	Min	Max	Unit
f _{SCK} 1/t _{c(SCK)}	SPI clock frequency	Master mode	-	36	MHz
		Slave mode	-	36	
t _{r(SCK)} t _{f(SCK)}	SPI clock rise and fall time	Capacitive load: C = 15 pF	-	6	ns
t _{su(NSS)}	NSS setup time	Slave mode	2 T _{pclk}	-	ns
t _{h(NSS)}	NSS hold time	Slave mode	2 T _{pclk}	-	ns
t _{w(SCKH)} t _{w(SCKL)}	SCK high level/low level time	Master mode, presc = 2	T _{pclk} - 2	T _{pclk} + 1	ns
t _{su(MI)} t _{su(SI)}	Data input setup time	Master mode	1	-	ns
		Slave mode	3	-	
t _{h(MI)} t _{h(SI)}	Data input hold time	Master mode	5	-	ns
